Experimentele Technieken

in de Hoge Energie Fysica en verdere toepassingen

Deel 1: Inleiding

Prof. Dr. Albert De Roeck
CERN, Geneva, Switzerland
Universiteit Antwerpen
UC Davis, California

Kursus inhoud

- Inleiding tot experimenten in de Hoge Energie Fysica
- Voorbereiding op de Large Hadron Collider (LHC).
- Instrumentatie
  - Deeltjes doorheen materie
  - Detector principes
  - Recente ontwikkelingen
- Detail studie van detektoren voor de LHC (CMS, ATLAS, ALICE, LHCb…). Detektor uitdagingen
- Detail studie van andere detektoren (Cosmic rays, lineaire versneller, experimenten voor kosmologie, gravitatiegolven, andere gebieden (geneeskunde…))

Kursus inhoud

- Inleiding, tot het CMS experiment
- Daarna gespecializeerde detectoren
- Dan neemt prof D'Hondt over met trigger, DAQ, ….
- Geen examen maar permanente evaluatie
- Opdrachten (1 per persoon). Voorbeelden
  - Deeltjes door materie
  - Detectoren in detail (vanuit leerboeken)
  - CMS Subdetectoren in detail (Tracker, ECAL, HCAL, muons,…)
  - Andere experimenten (WMAP, Auger, Gravitatie experimenten, LHC experimenten)..
  - Echte experimentele papers (van CMS)
    - Start met projecten na de les volgende week

Projekten

- Voorbeelden van projekten
- Bekijken van detektoren in detail
  - Gas tracker detektoren
  - Halfgeleider tracker detektoren
  - Electromagnetische calorimeters
  - Hadronische calorimeters
  - Deeltjes flow voor precisie meetingen
  - Experimentele triggers
  - Speciale experimenten
  - Experimentele meetingen en resultaten (CMS/ Tevatron)

Timeline & Projects

- Report (5-10 pages) + Presentation of ~ 15 minutes
- When (some time December or January)?
- ⇒ Agenda

Friday Sept 30- 9:00-12:00 Les 1 (De Roeck) - UA
Friday Oct 7 - 9:00-12:00 Les 2
Friday Oct 14 – 9:00-12:00 Les 3
Friday Nov 18 - 9:00-12:00 Les 4
Friday Nov 25 – 9:00-12:00 Les 1 (D'Hondt) - VUB
Friday Dec 9 - 9:00-12:00 Les 2
Friday Dec 16 - 9:00-12:00 Les 3
Friday Dec 23 - 9:00-12:00 Les 4

Projects

- Simple Projects (*)
  - Derive the Bethe Bloch Formula (Grupen)
  - Cherenkov light radiation (Grupen)
- Other key experiments (**)
  - The Auger cosmic ray experiment. Ultra High Cosmic Rays
  - The WMAP experiment (satellite, dark matter/dark energy)
  - The Planck experiment (satellite, dark mater dark energy)
  - Ligo: gravitational waves / laser interferometry
  - The MOEDAL experiment at CERN (monopole search)
  - Neutrino experiments (eg OPERA)
- Detection techniques (**)
  - General: EM shower calorimeters (Grupen)
  - Hadronic shower calorimeters (Grupen)
  - Compensating calormeters (Wigmans lectures)
  - Dual readout calorimeters (Wigmans lectures)
  - Silicon detectors (Kleinknecht)
  - MSGC gas detectors
- Difficult projects (***)
  - CMS papers with real data (calibration, alignment, efficiency of CMS detector)

Last Friday: Strange Neutrinos

Faster than the speed of light?

Measure:
-Starting time
-Arrival time
-Distance

Neutrinos arrive 60 nsecs to early

Why the LHC

The LHC is the most complex,
most challenging and at the same time one of the most anticipated scientific instruments so far built by mankind:

The Large Hadron Collider (LHC), built at CERN, Switzerland

- What Is CERN?
- What is the Large Hadron Collider?
- What are the challenges of the collider and experiments?
- What is the science of the Large Hadron Collider?

CERN
The European Laboratory for Particle Physics

CERN is the European Organization for Nuclear Research, the world's largest Particle Physics Centre, near Geneva, Switzerland
It is now commonly referred to as European Laboratory for Particle Physics
It was founded in 1954 and has 20 member states + several observer states
CERN employes >3000 people + hosts 9000 visitors from >500 universities.
Annual budget ~ 1100 MCHF/year (2010)

CERN: the place where the World Wide Web was born

The 20 CERN Member States

US is an observer state… US contributed to the LHC.

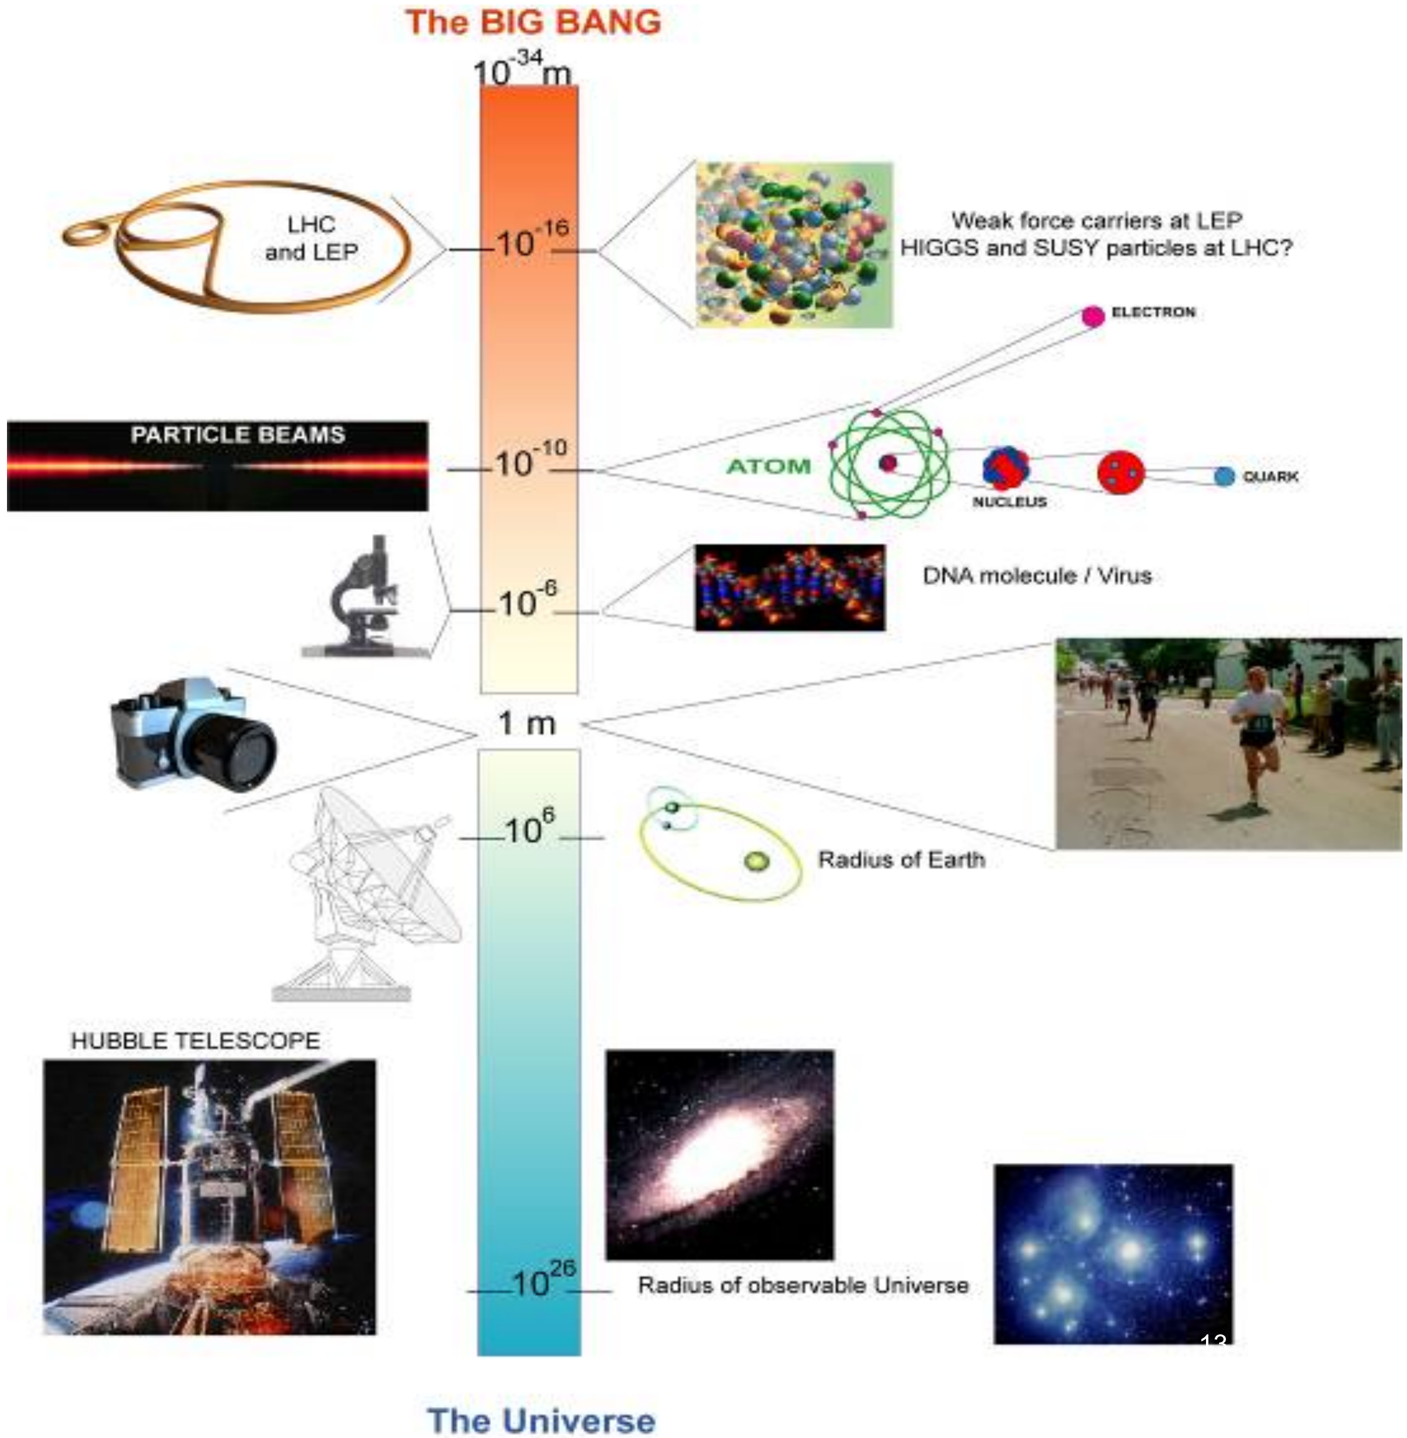
CERN
Provides
Particle Beams
&
Research Infrastructure

Why do we need particle accelerators?

What is the world made of?
What holds the world together?
Where did we come from?

Different types of tools and equipment are needed
to observe different sizes
of object

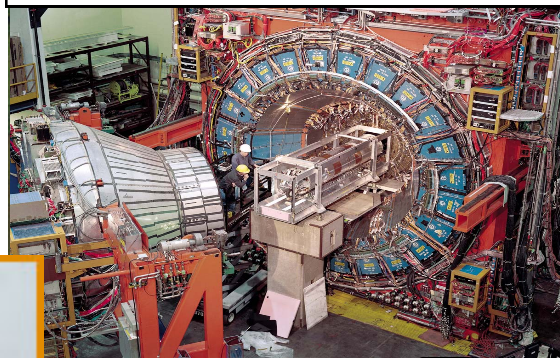
Only particle accelerators
can explore the tiniest
objects in the Universe

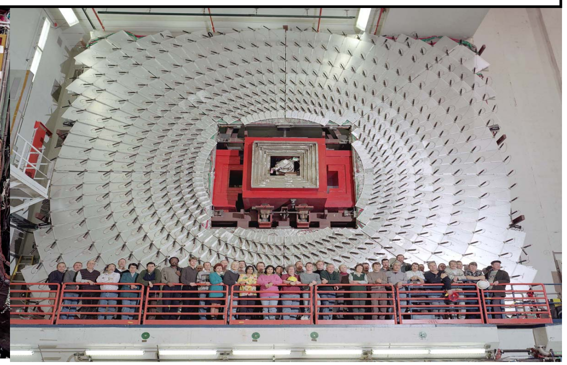


Many generations of accelerators created
with higher and higher energy given to the beam particle

Ernest Lawrence
(1901 - 1958)

CDF ~1500 Scientists DZero



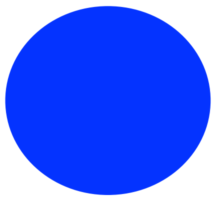


Tevatron at Fermilab
x10^4 bigger, x10^6 higher energy

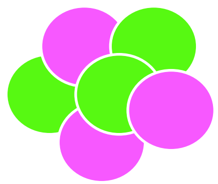
Accelerators are Powerful Microscopes.

They make high energy particle beams
that allow us to see small things.

$$\lambda = \frac{h}{p}$$



seen by
low energy beam
(poorer resolution)



seen by
high energy beam
(better resolution)

We can create particles from energy

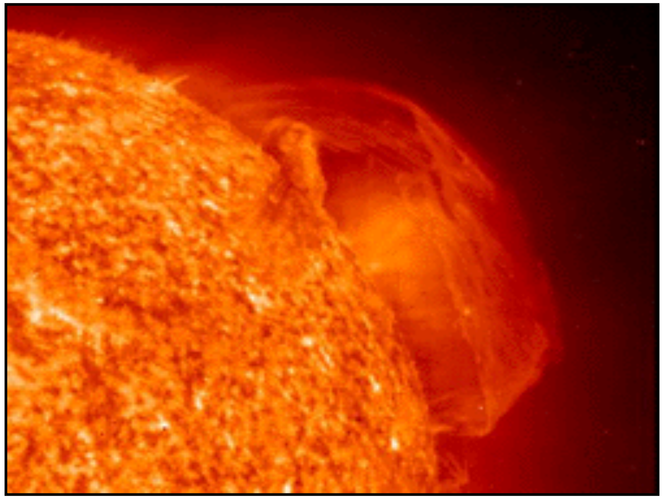
Two beams of protons collide and generate, in a very tiny space, temperatures over a billion times higher than those prevailing at the center of the Sun.

The Fundamental Forces of Nature

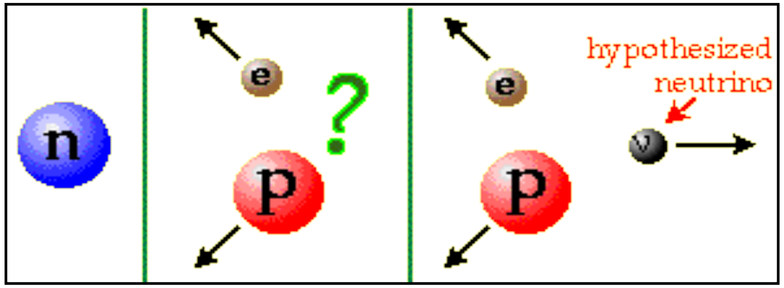
Electromagnetism:
gives light, radio, holds atoms together

Strong Nuclear Force:
holds nuclei together

Weak Nuclear Force:
gives radioactivity



together they make the Sun shine



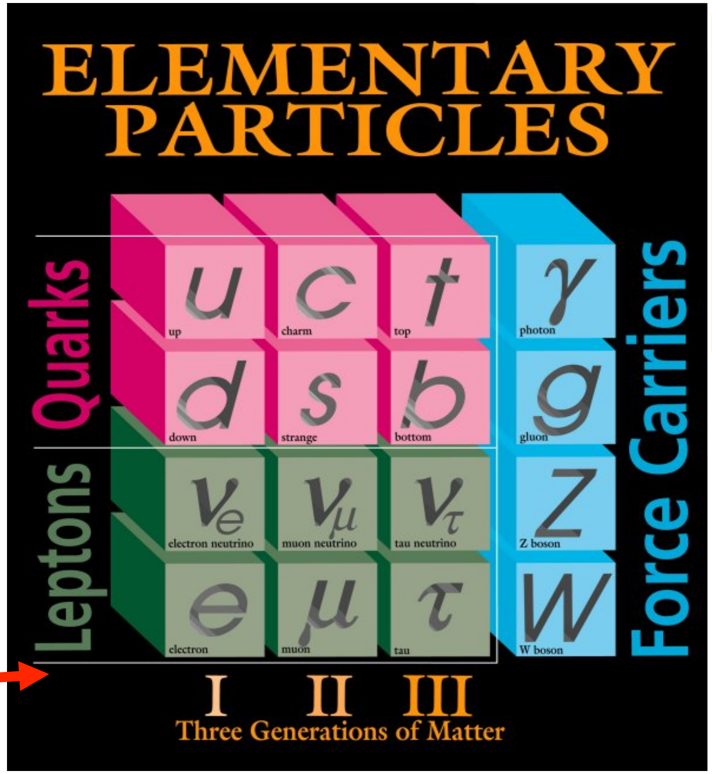
Gravity:
holds planets and stars together

The Standard Model in Particle Physics

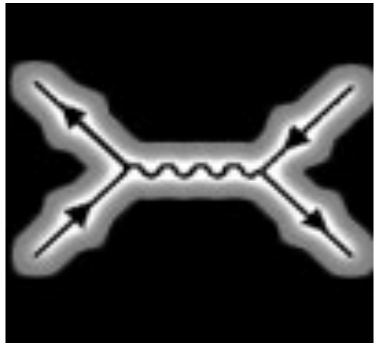
But not all questions solved:

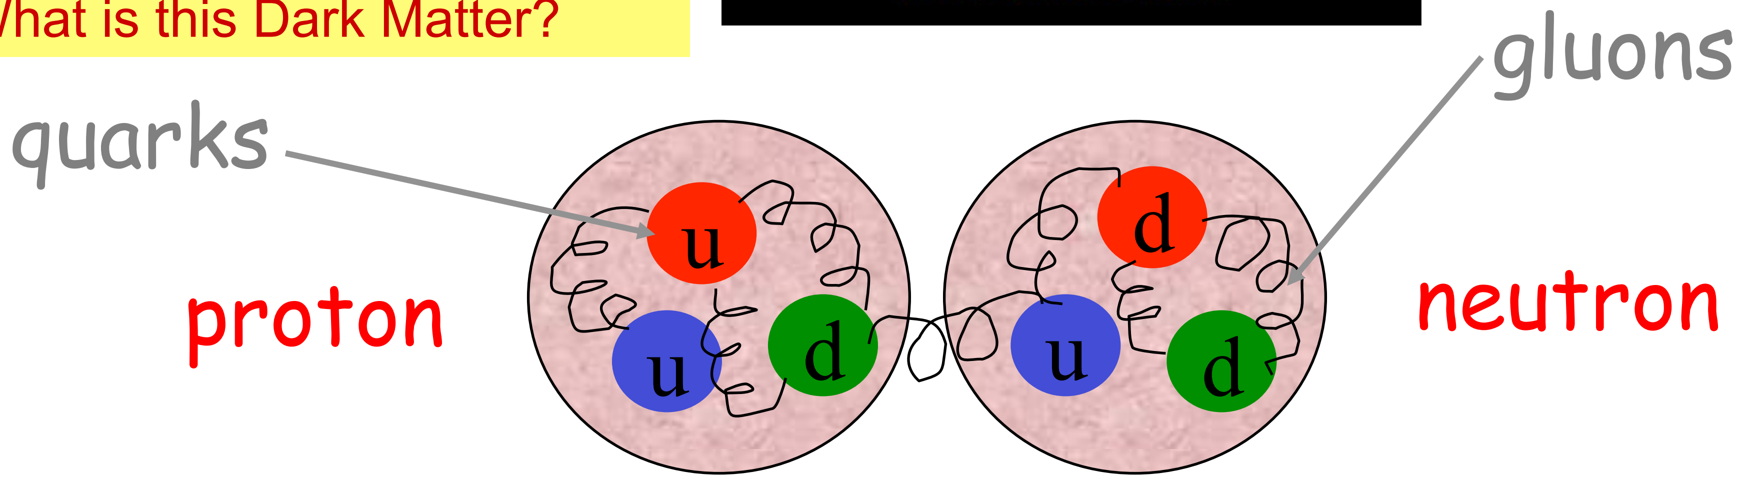
Why is the top quark much more heavy than the quarks
⇒Mass(top) = gold nucleus
What is the origin of mass?

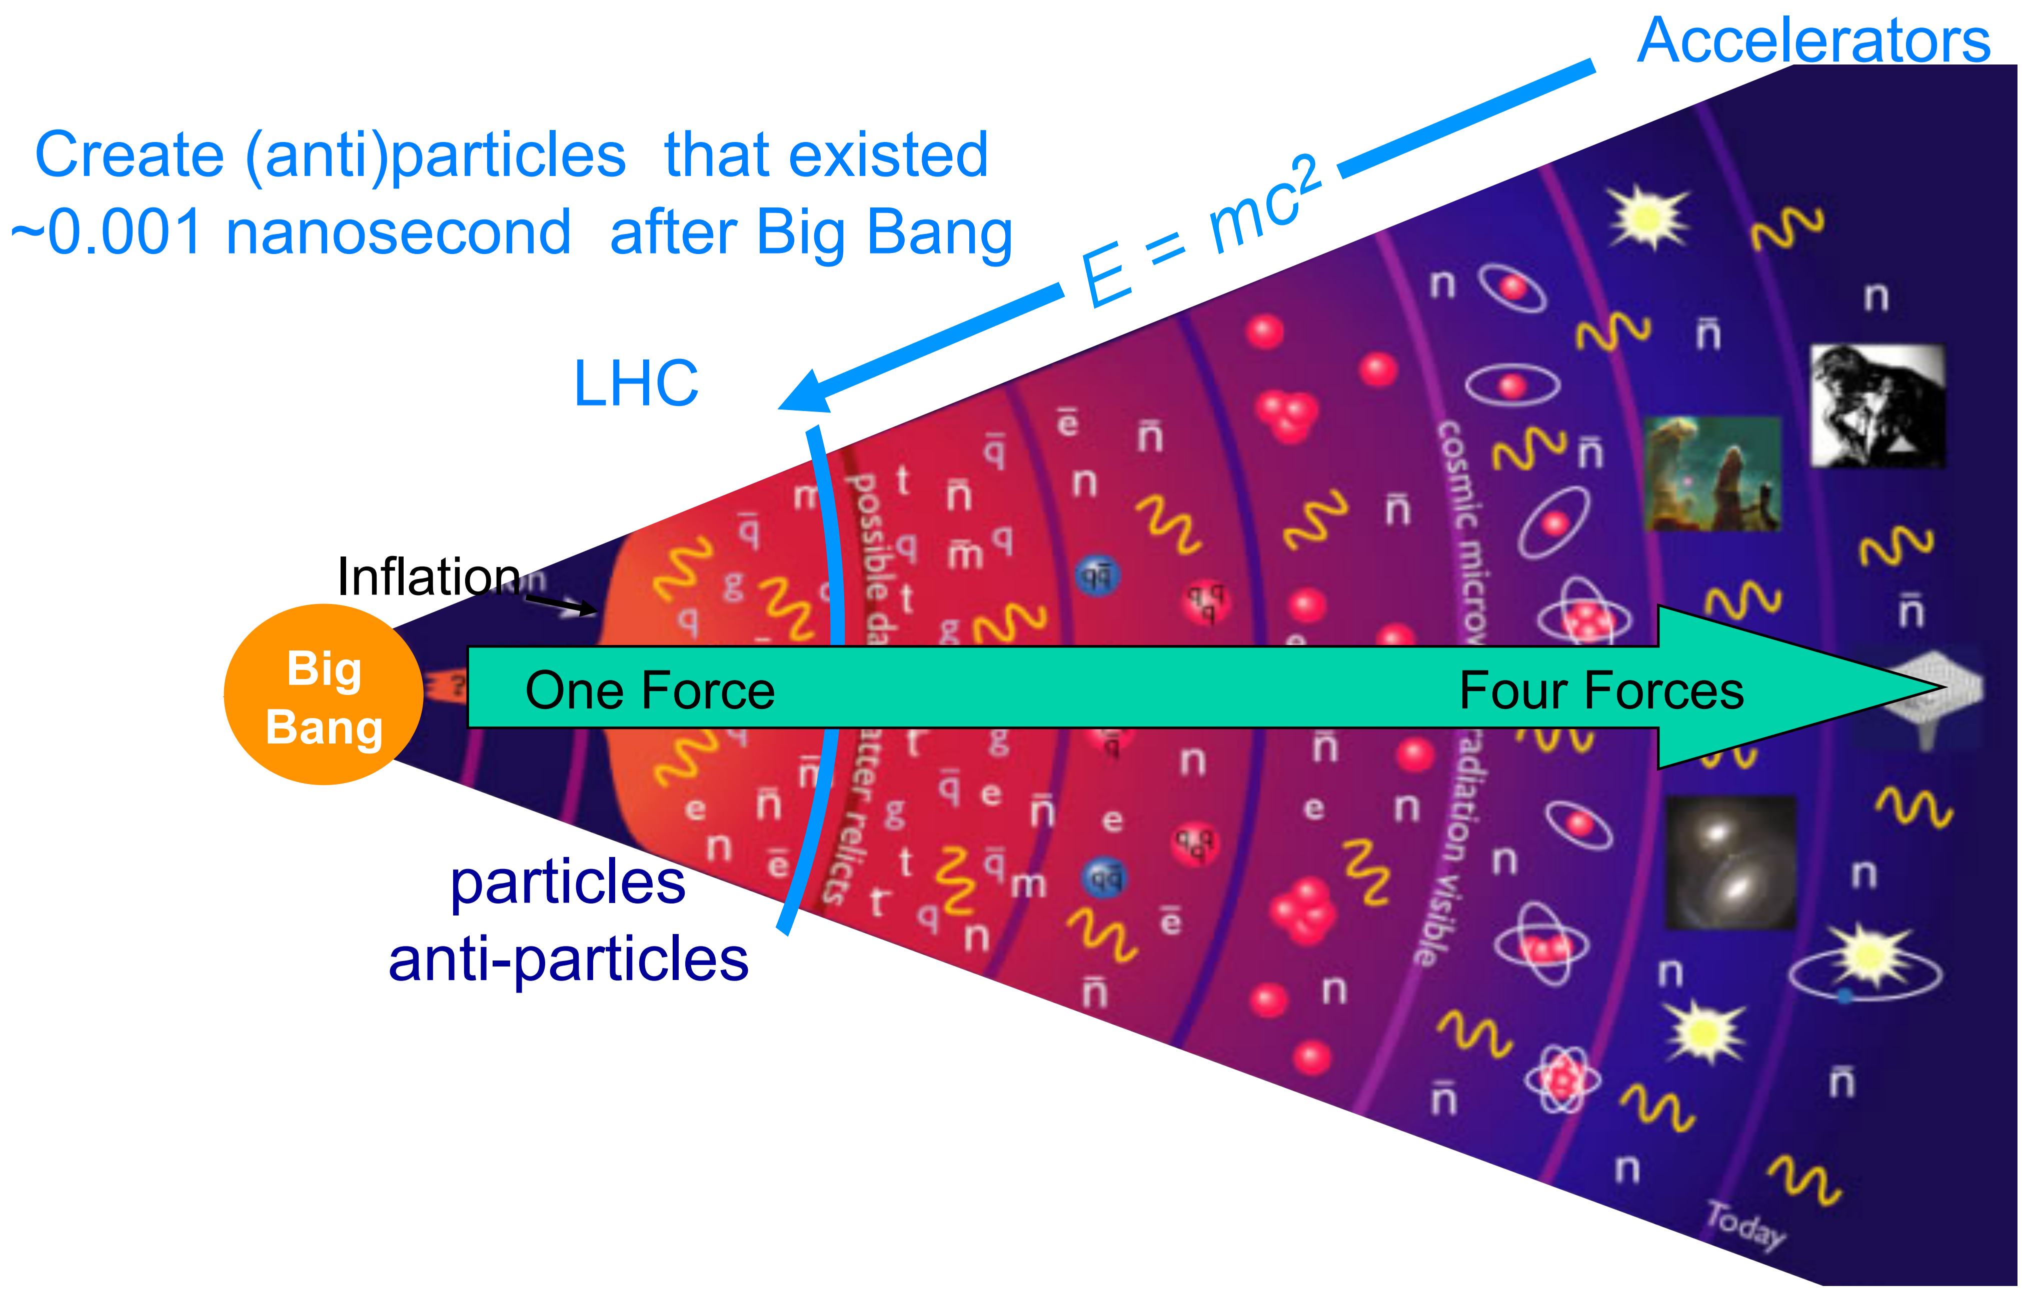
Astrophysics/cosmological measurements show that most matter in the universe is NOT in this table
What is this Dark Matter?



Four known forces
- Gravity
- Electro-magnetisme
- Strong nuclear force
- Weak force







Accelerators
Create (anti)particles that existed

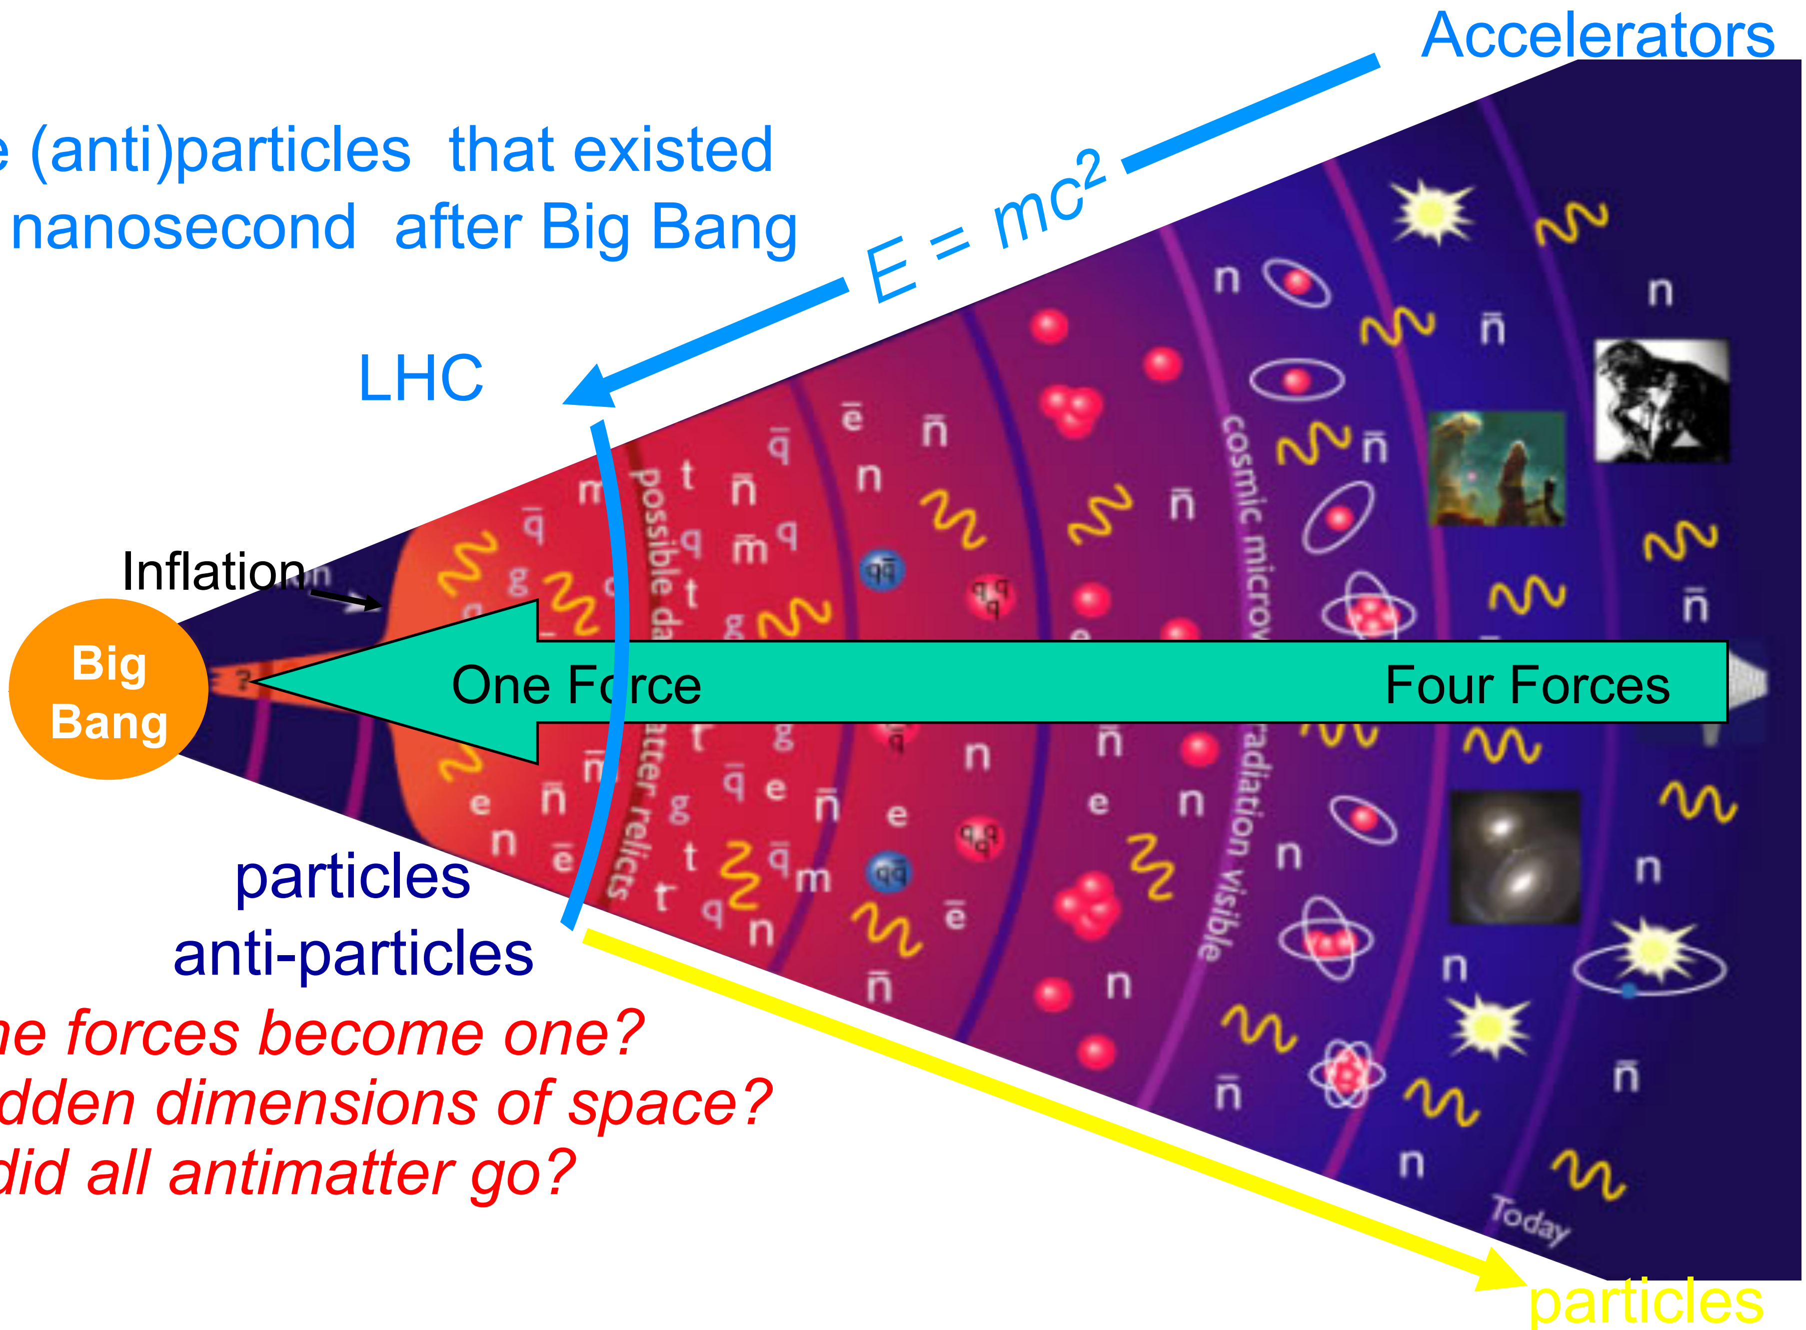
cosmic microwave radiation
visible
Today

Create (anti)particles that existed
~0.001 nanosecond after Big Bang



Do all the forces become one?
Extra hidden dimensions of space?
Where did all antimatter go?

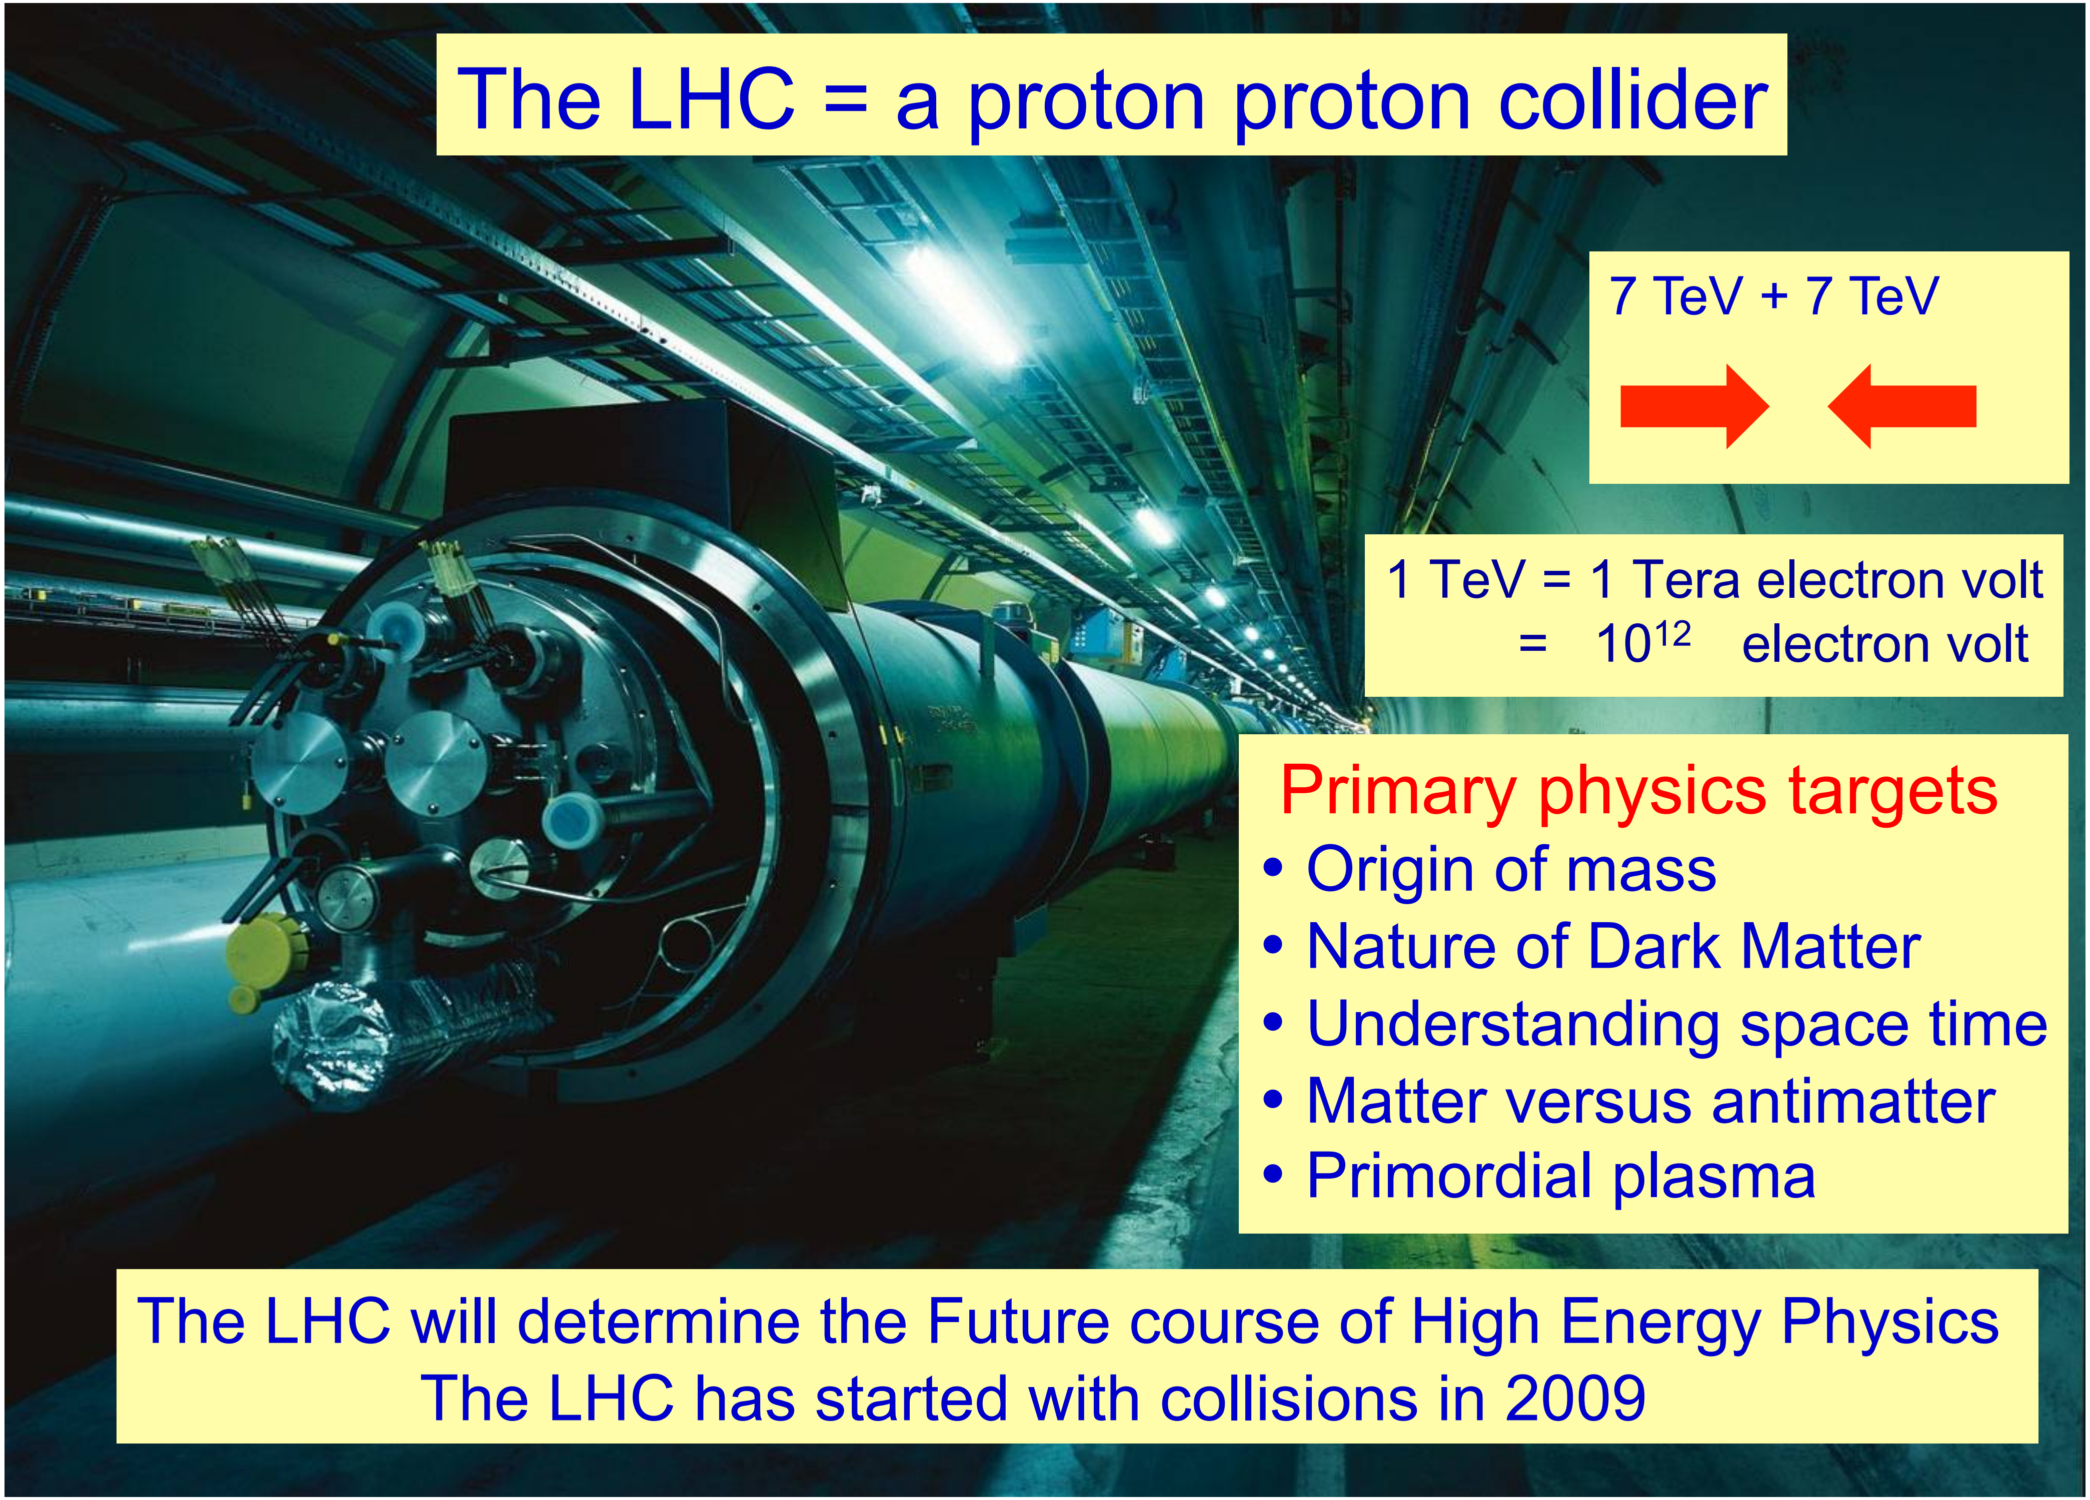
1. Are there undiscovered principles of nature: New symmetries, new physical laws?
2. How can we solve the mystery of dark energy?
3. Are there extra dimensions of space?
4. Do all the forces become one?
5. Why are there so many kinds of particles?
6. What is dark matter? How can we make it in the laboratory?
7. What are neutrinos telling us?
8. How did the universe come to be?
9. What happened to the antimatter?
10. What is mass?

"Quantum Universe" and "Discovering the Quantum Universe"

Evolved Thinker

Discoveries and breakthroughs will likely come from Energy Frontier Accelerators at the Terascale.

The LHC = a proton proton collider



7 TeV + 7 TeV

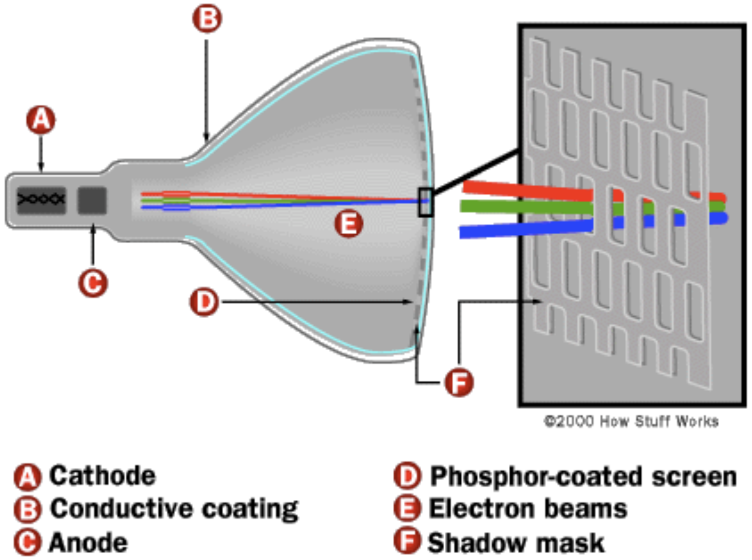
1 TeV = 1 Tera electron volt
= 10^{12} electron volt

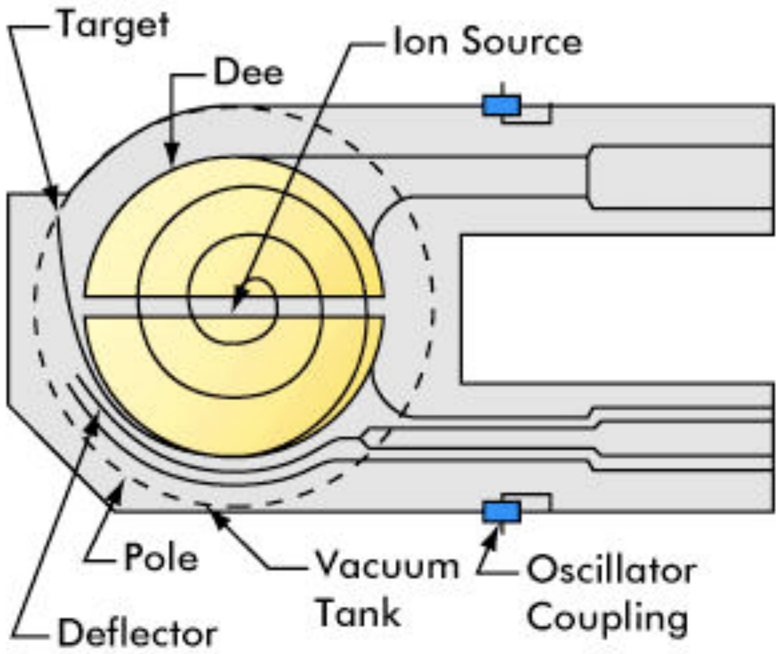
Primary physics targets

- Origin of mass
- Nature of Dark Matter
- Understanding space time
- Matter versus antimatter
- Primordial plasma

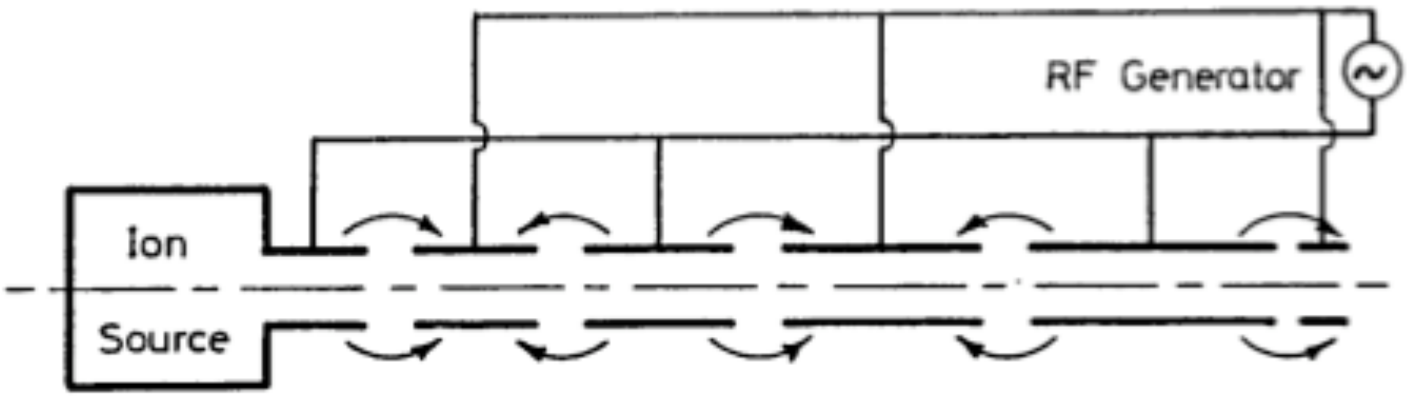
The LHC will determine the Future course of High Energy Physics
The LHC has started with collisions in 2009

Accelerators for Charged Particles





Schematic diagram of a cyclotron



Recent High Energy Colliders

Highest energies can be reached with proton colliders

Machine	Year	Beams	Energy ($\sqrt{s}$)	Luminosity
SPPS (CERN)	1981	pp	630-900 GeV	$6.10^{30}cm^{-2}s^{-1}$
Tevatron (FNAL)	1987	pp	1800-2000 GeV	10^{31}-$10^{32}cm^{-2}s^{-1}$
SLC (SLAC)	1989	e^+e^-	90 GeV	$10^{30}cm^{-2}s^{-1}$
LEP (CERN)	1989	e^+e^-	90-200 GeV	10^{31}-$10^{32}cm^{-2}s^{-1}$
HERA (DESY)	1992	ep	300 GeV	10^{31}-$10^{32}cm^{-2}s^{-1}$
RHIC (BNL)	2000	pp / AA	200-500 GeV	$10^{32}cm^{-2}s^{-1}$
LHC (CERN)	2009	pp (AA)	10-14 TeV	10^{33}-$10^{34}cm^{-2}s^{-1}$

Luminosity = number of events/cross section/sec

- Limits on circular machines
  - Proton colliders: Dipole magnet strength →superconducting magnets
  - Electron colliders: Synchrotron radiation/RF power

Accelerators: developed in physics labs are used in hospitals for HADRON Therapy

Around 9000 of the 17000 accelerators operating in the world today are used for medicine

The LHC: >20 Years Already!

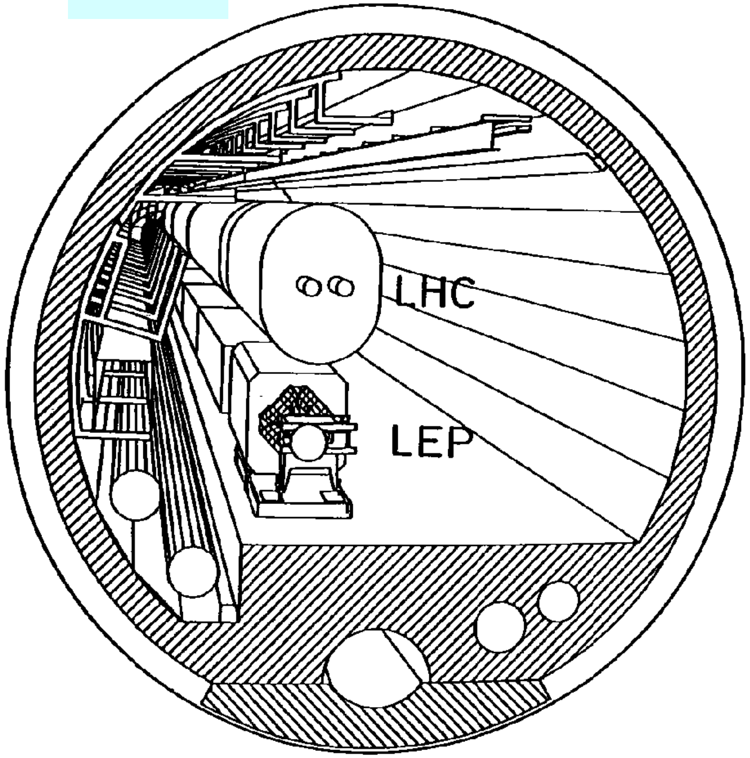
LHC History

1982 : First studies for the LHC project
1983 : Z0/W discovered at SPS proton antiproton collider
1989 : Start of LEP operation (Z boson-factory)
1994 : Approval of the LHC by the CERN Council
1996 : Final decision to start the LHC construction
1996 : LEP operation > 80 GeV (W boson -factory)
2000 : Last year of LEP operation above 100 GeV
2002 : LEP equipment removed
2003 : Start of the LHC installation
2005 : Start of LHC hardware commissioning
2008 : Expected LHC commissioning with beam

Luminosity=# events/cross section/sec

1984

ECFA 84/85
CERN 84-10
5 September 1984

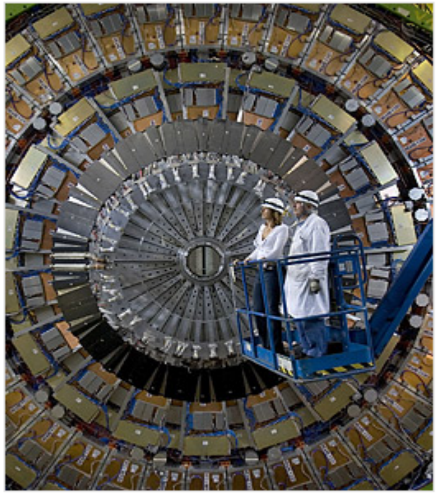


1984:	cms energy	10-18 TeV
	Luminosity	10^{31}-10^{33}cm^{-2}s^{-1}
1987:	cms energy	16 TeV
	Luminosity	10^{33}-10^{34}cm^{-2}s^{-1}
Final:	cms energy	14 TeV
	Luminosity	10^{33}-10^{34}cm^{-2}s^{-1}

TIME's Best Inventions of 2008

The Other 49 Best Inventions

5. The Large Hadron Collider

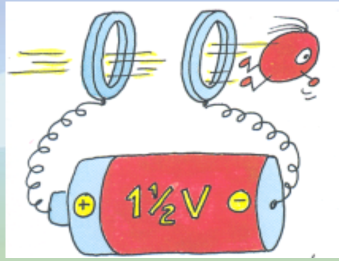


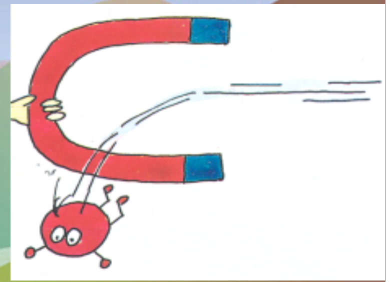
STEFANO DAL POZZOLO / CONTRASTO / REDUX

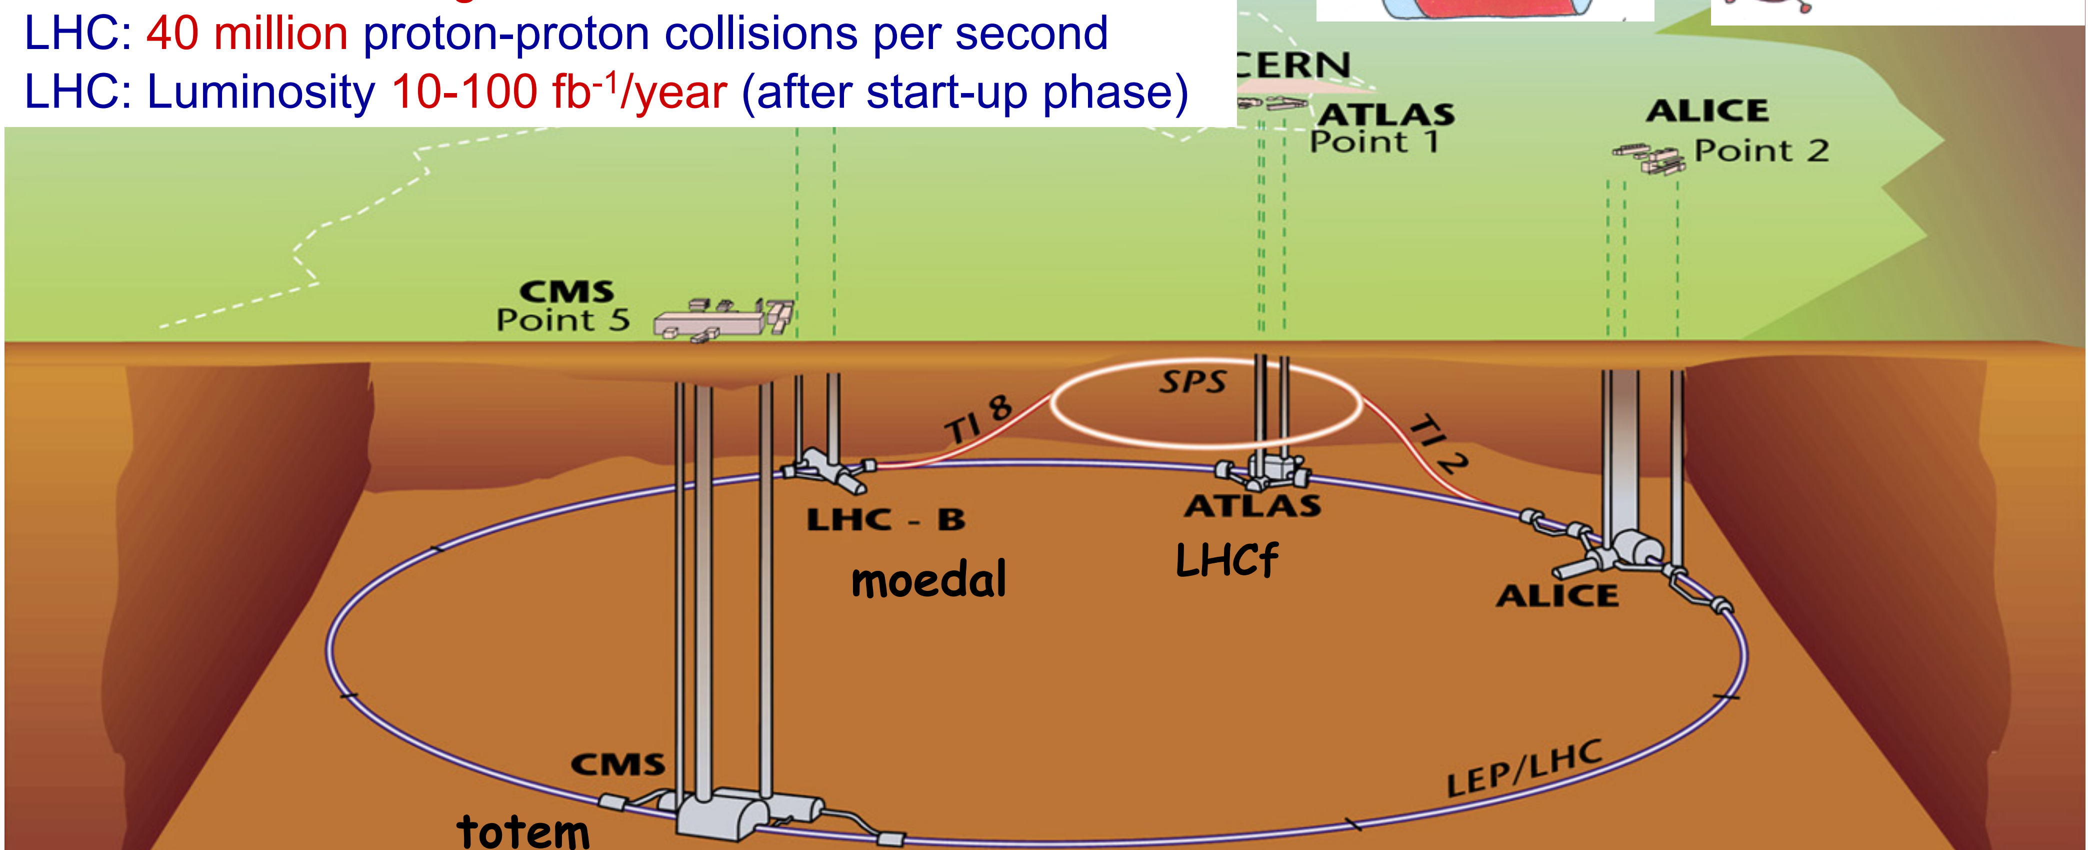
If someone invented a practical 200-m.p.g. automobile and that automobile got a flat tire, nobody would claim that the car itself was a failure. The same applies to the Large Hadron Collider, the world's biggest particle accelerator, which went online in September, ran for 10 days and then had to shut down at least until next spring because of an overheated wire. The mammoth machine will send protons wheeling in opposite directions at nearly the speed of light, then smash them together at 6,000 times a second to try to answer such deep questions as why mass exists and whether the universe has extra dimensions. If it takes a few extra months to find out, so what?

The LHC Machine and Experiments

LHC is 100m underground
LHC is 27 km long
Magnet Temperature is 1.9 Kelvin = -271 Celsius
LHC has ~ 9000 magnets
LHC: 40 million proton-proton collisions per second
LHC: Luminosity 10-100 fb^{-1}/year (after start-up phase)



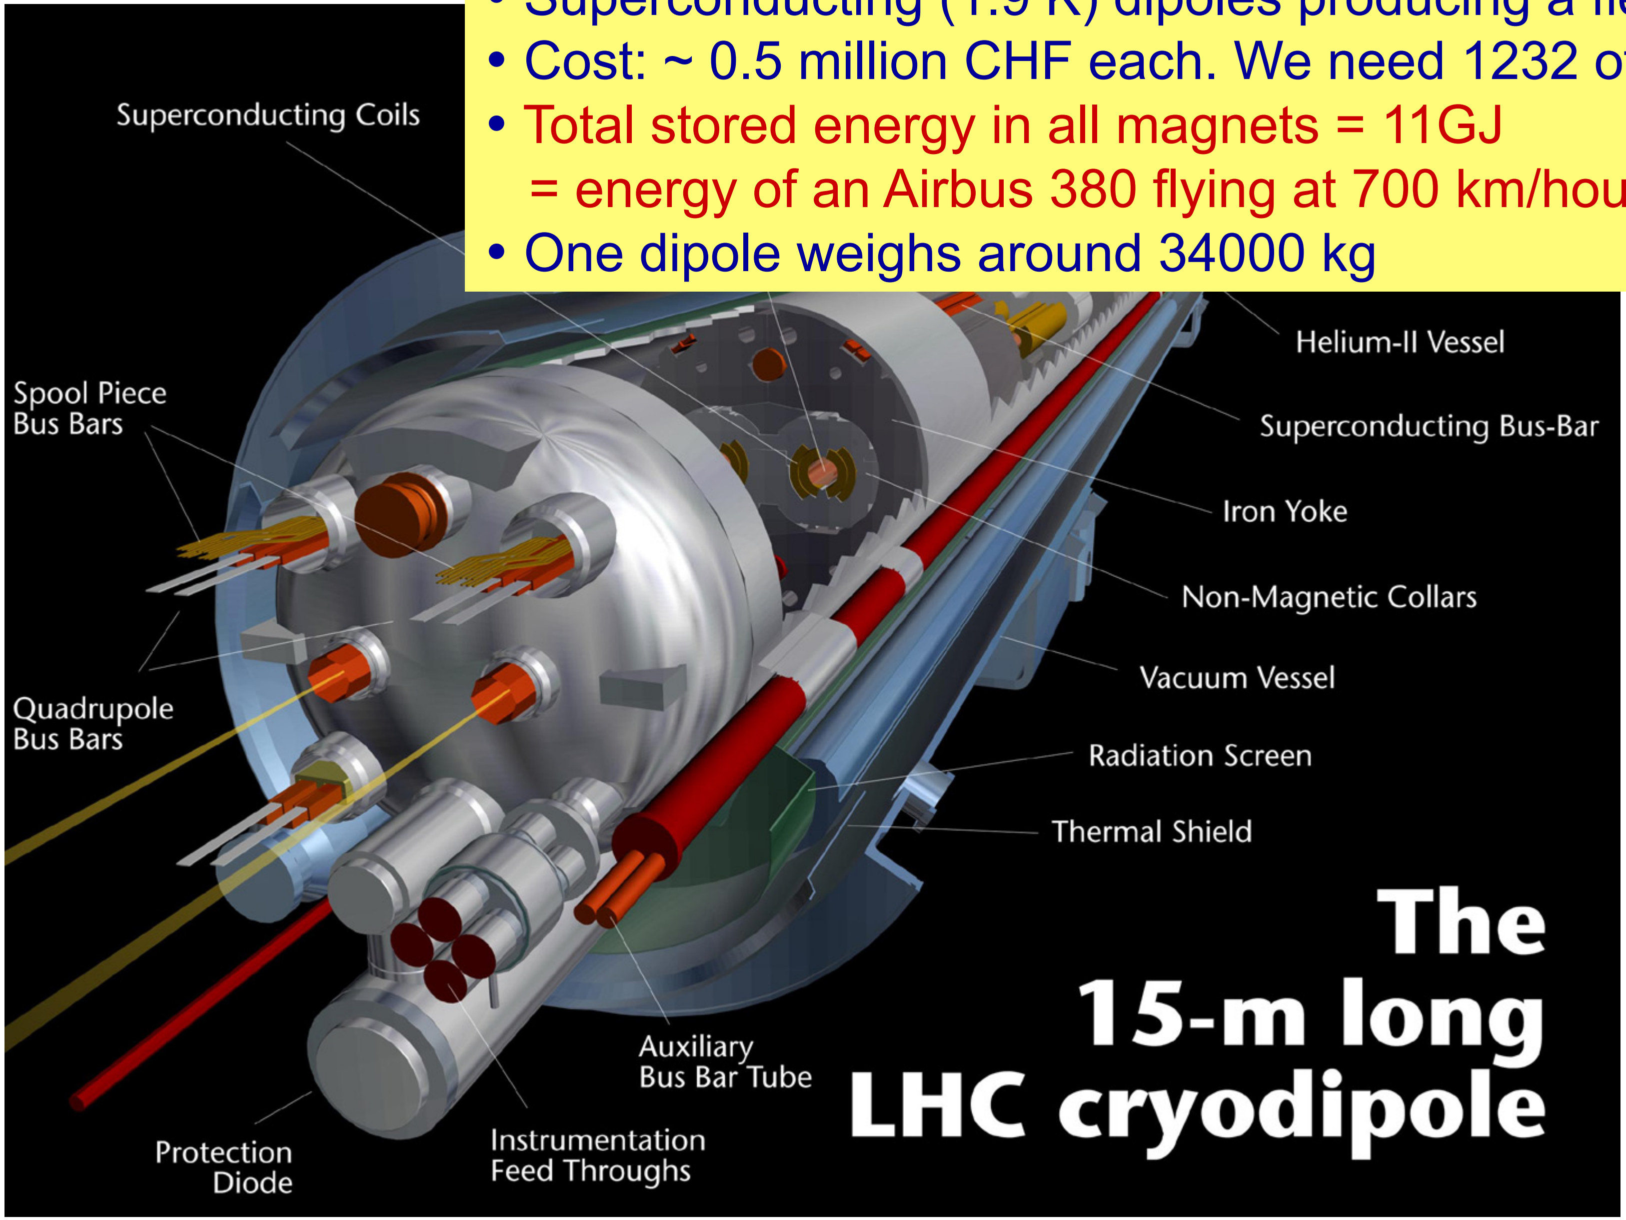




•High Energy ⇒ factor 7 increase w.r.t. present accelerators
•High Luminosity (# events/cross section/time) ⇒ factor 100 increase

The Cryodipole Magnets

- Superconducting (1.9 K) dipoles producing a field of 8.4 T
- Cost: ~ 0.5 million CHF each. We need 1232 of them
- Total stored energy in all magnets = 11GJ
  = energy of an Airbus 380 flying at 700 km/hour
- One dipole weighs around 34000 kg



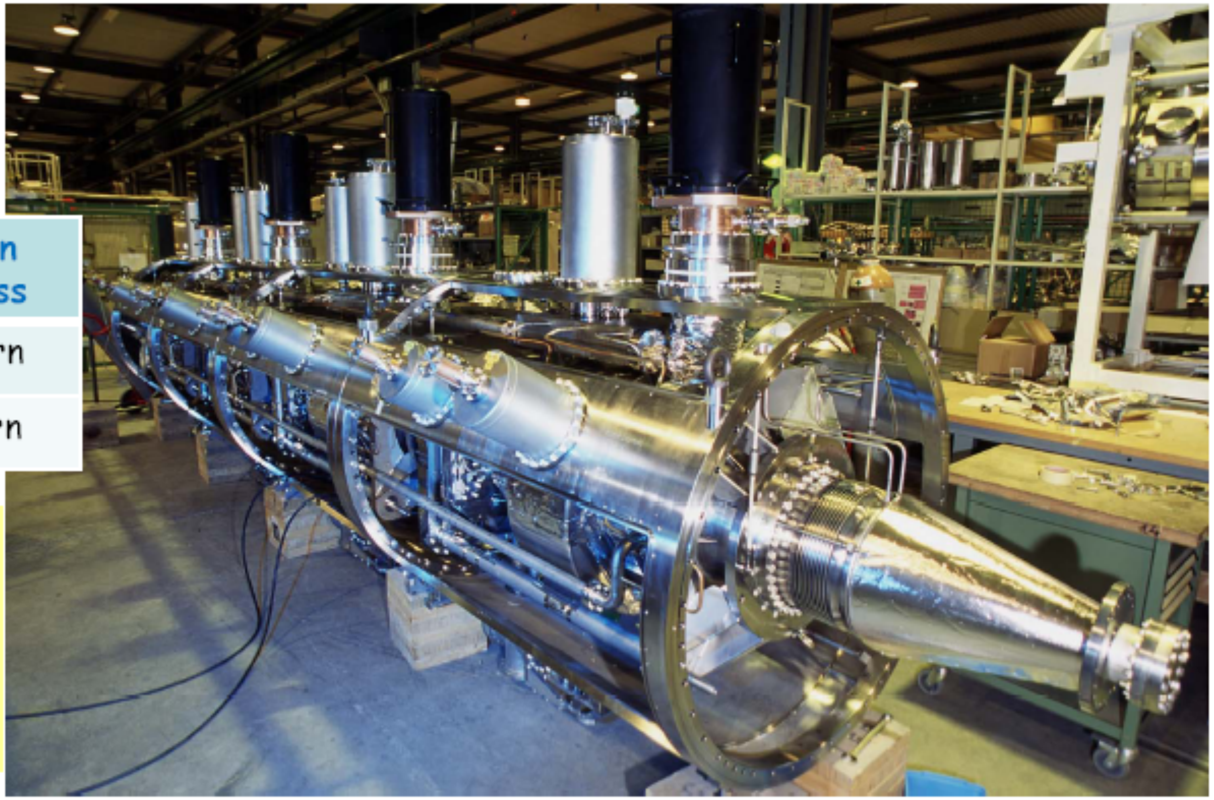
LHC RF system

- The LHC RF system operates at 400 MHz.
- It is composed of 16 superconducting cavities, 8 per beam.
- Peak accelerating voltage of 16 MV/beam.

For LEP at 104 GeV : 3600 MV/beam !

	Synchrotron radiation loss
LHC @ 7 TeV	6.7 keV /turn
LEP @ 104 GeV	~3 GeV /turn

The LHC beam radiates a sufficient amount of visible photons to be actually observable with a camera ! (total power ~ 0.2 W/m)

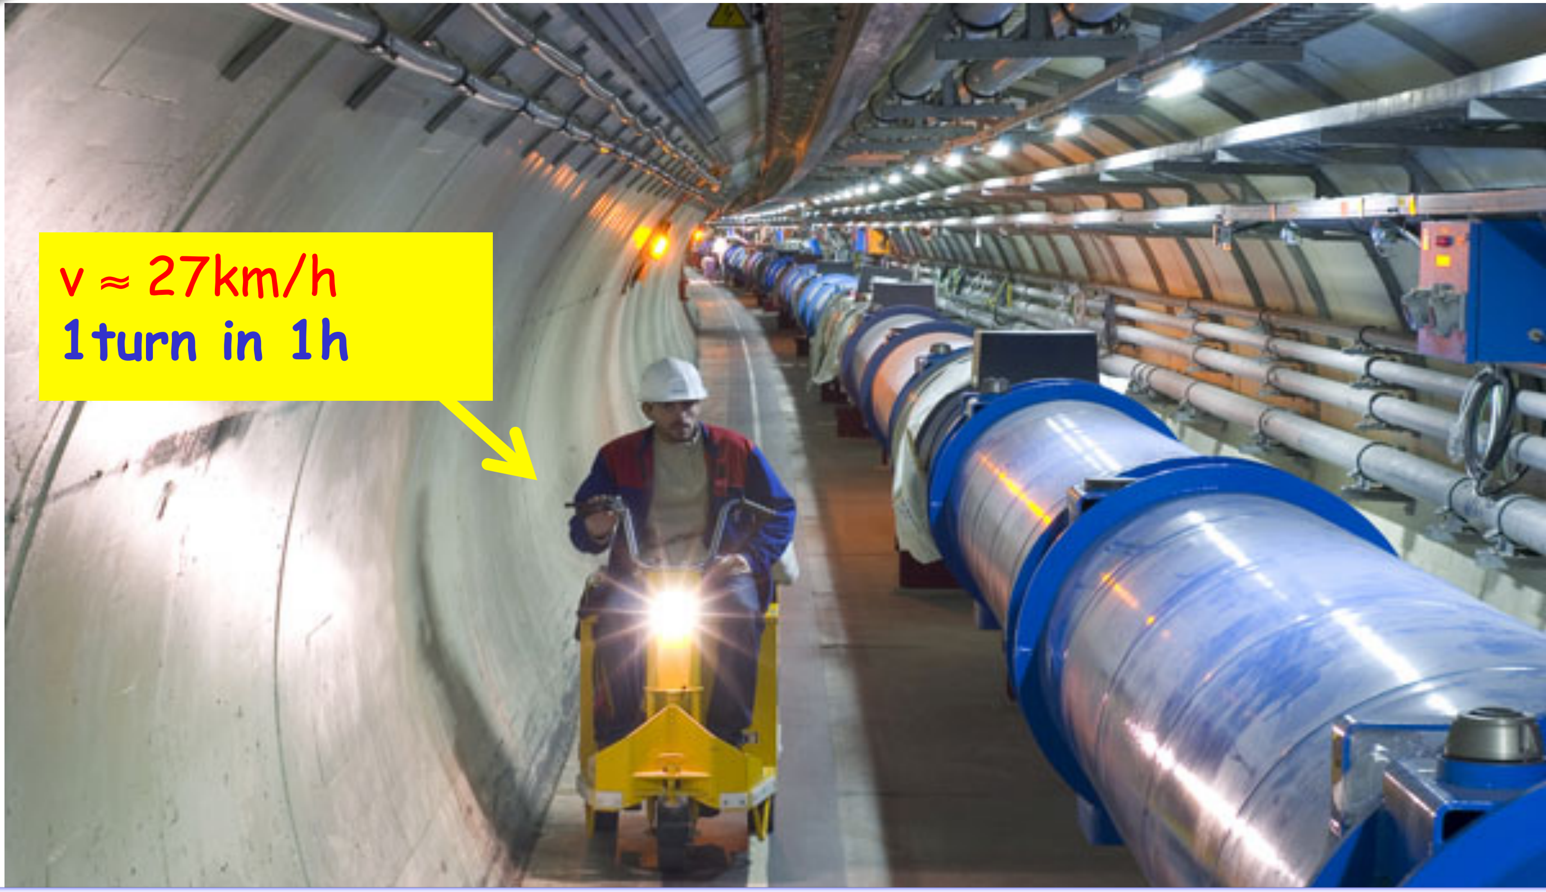


17

LHC facts

100 m underground: a tunnel 27 km circumference

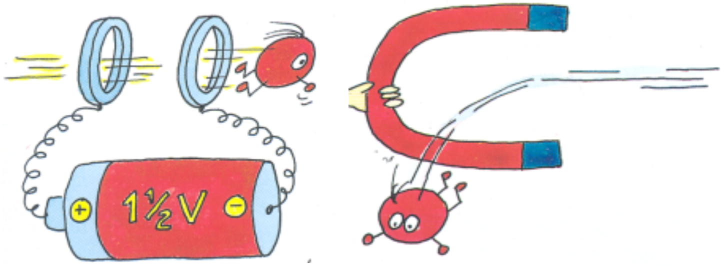
One of the **fastest** racetracks on the planet

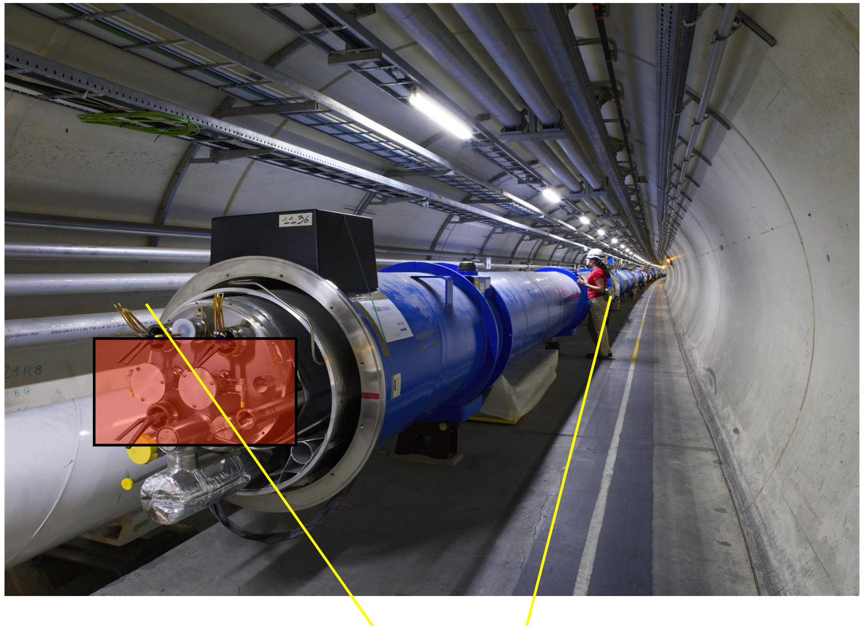


Several thousand billion protons traveling at 99.9999991% of the speed of light will travel round the 27km ring over 11000 times a second

LHC facts

The emptiest space in the solar system…





To accelerate protons to almost the speed of light, we need a vacuum similar to interplanetary space. The pressure in the beam-pipes of the LHC will be about ten times lower than on the moon.

LHC facts

One of the coldest places in the Universe…

the largest cryogenic system ever built

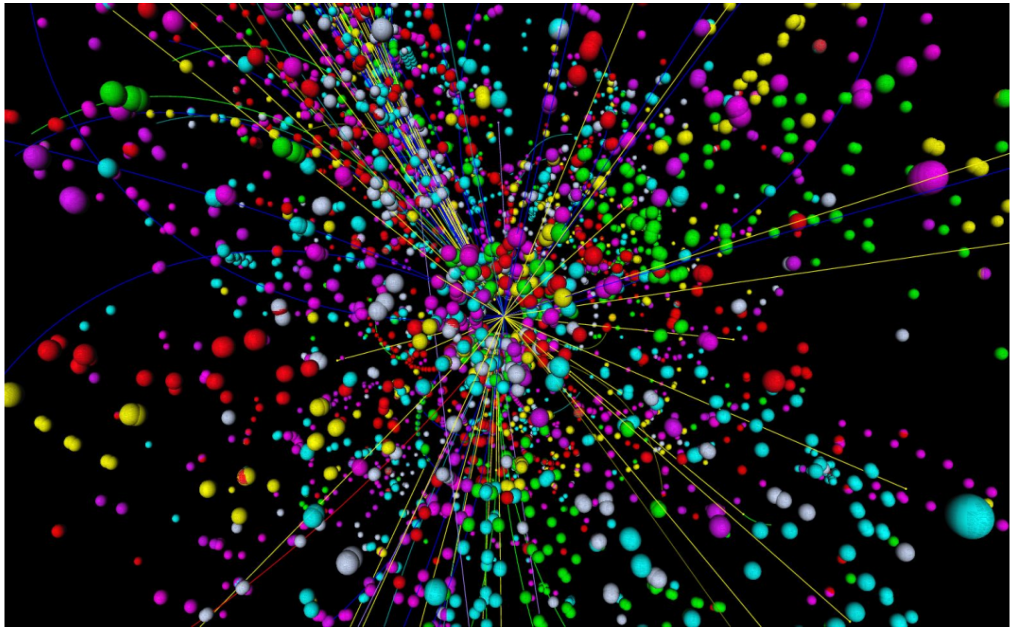
54 km fridge!

With a temperature of around -271 degrees Celsius, or 1.9 degrees above absolute zero, the LHC is colder than interstellar space.

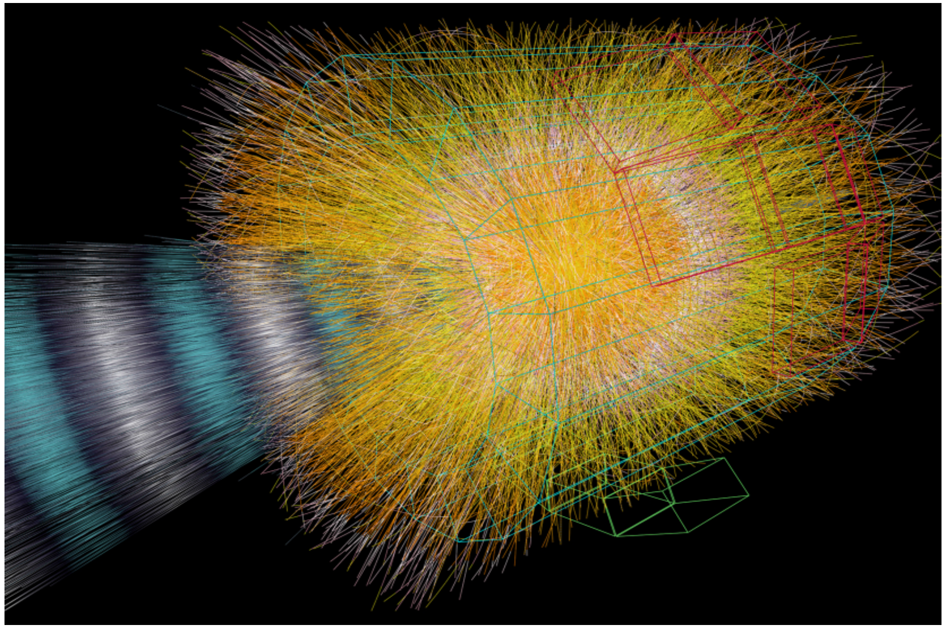
33

LHC facts

One of the hottest places in the Galaxy…



Simulation of a collision in the CMS experiment



Simulation of a collision in the ALICE experiment

When two beams of protons collide, they generate within a tiny volume, temperatures more than a billion times those in the very heart of the Sun.

34

Energy in the beam

Comparison…

The energy of an A380 at 700 km/hour corresponds to the energy stored in the LHC magnet system :

Sufficient to heat up and melt 12 tons of Copper!!

The energy stored in one LHC beam corresponds approximately to…

- 90 kg of TNT
- 8 litres of gasoline
- 15 kg of chocolate

It's how ease the energy is released that matters most !!

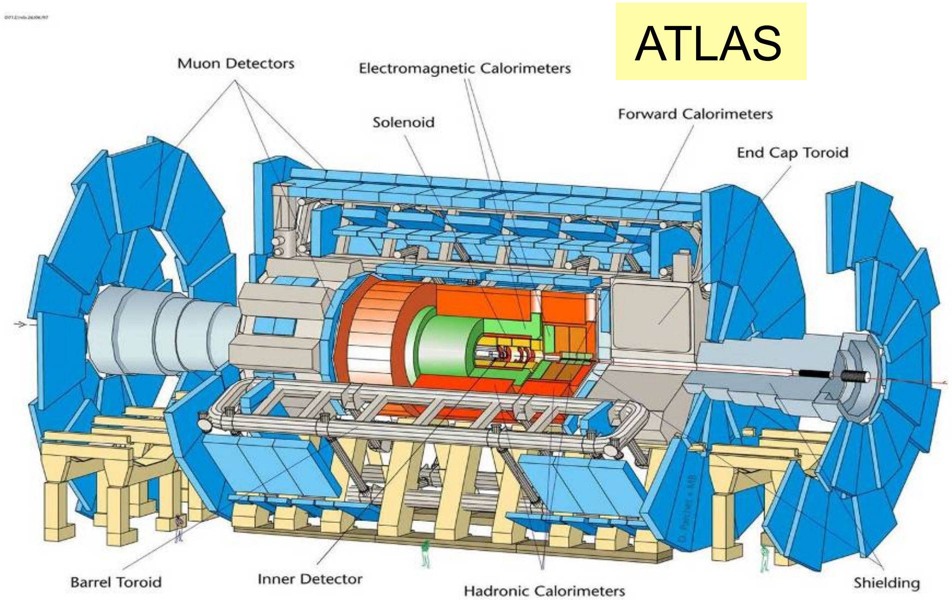
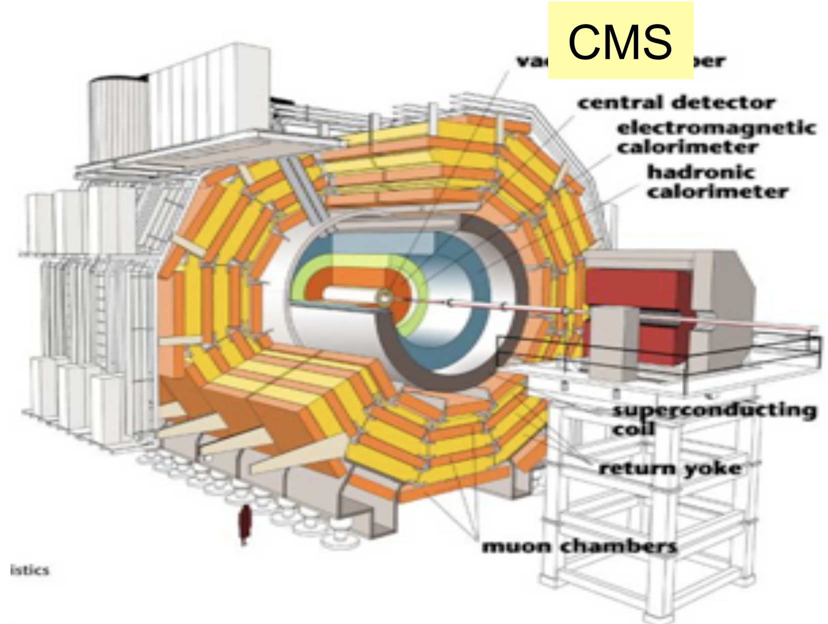
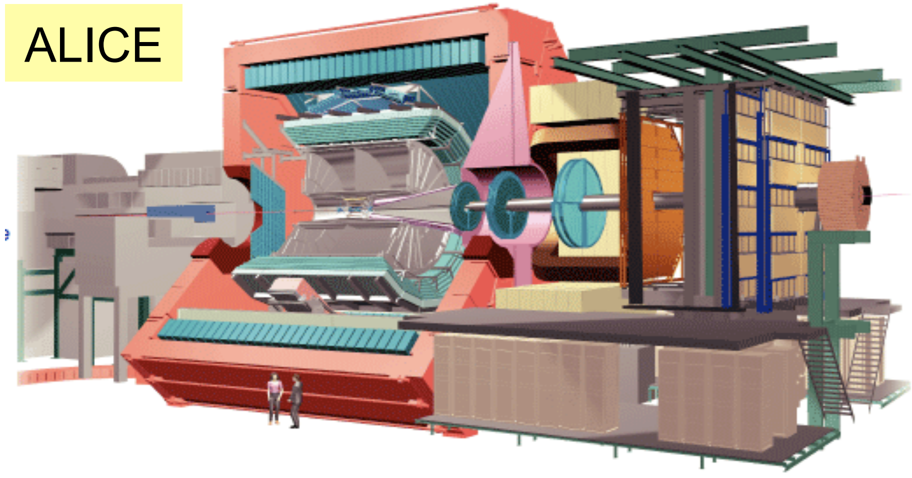
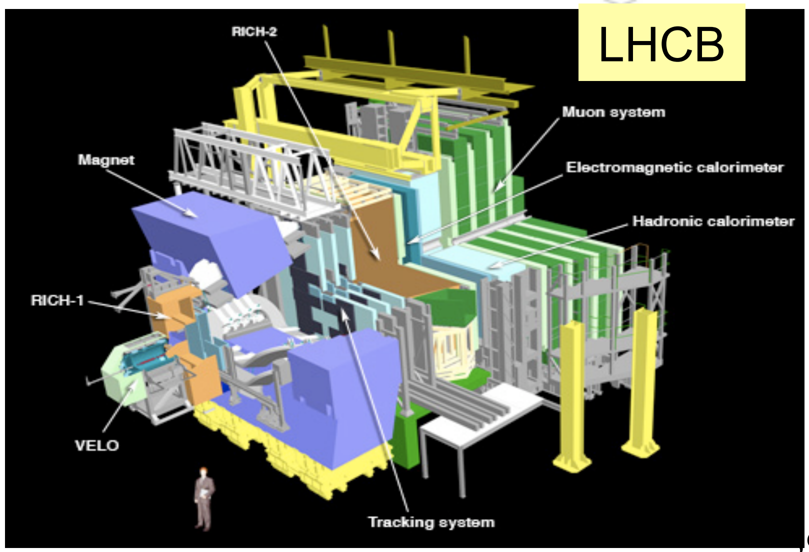
Experiments at the LHC

The Four Main LHC Experiments

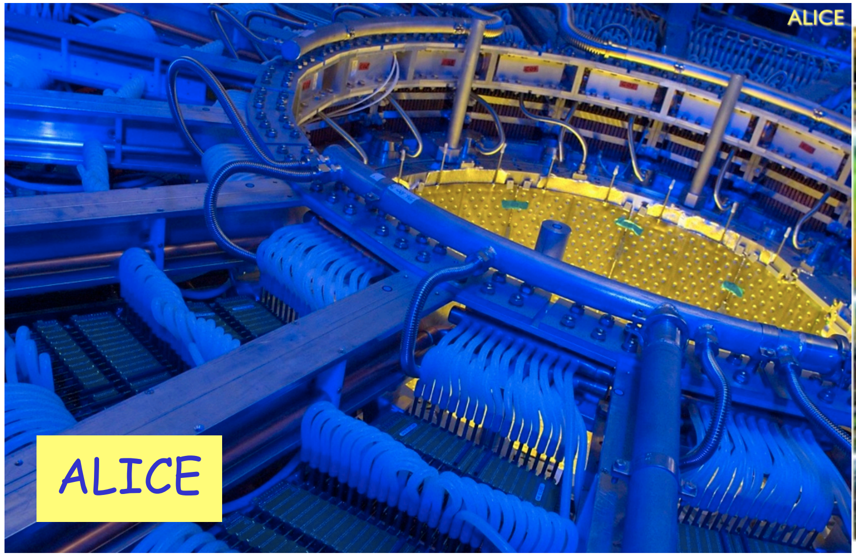


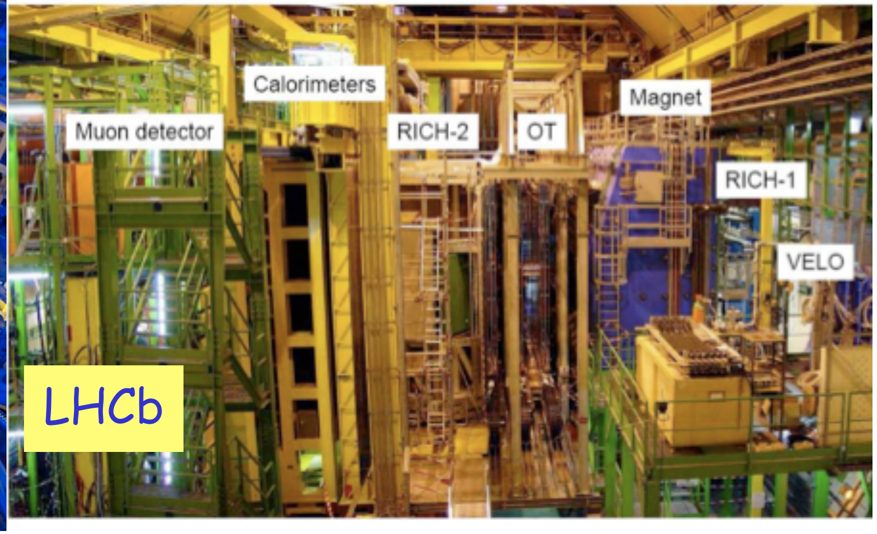


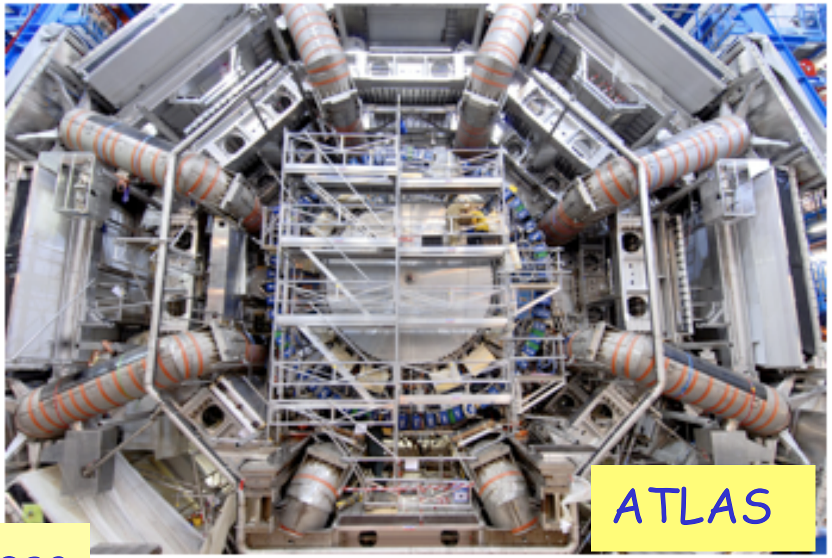




Detectors are essentially completed







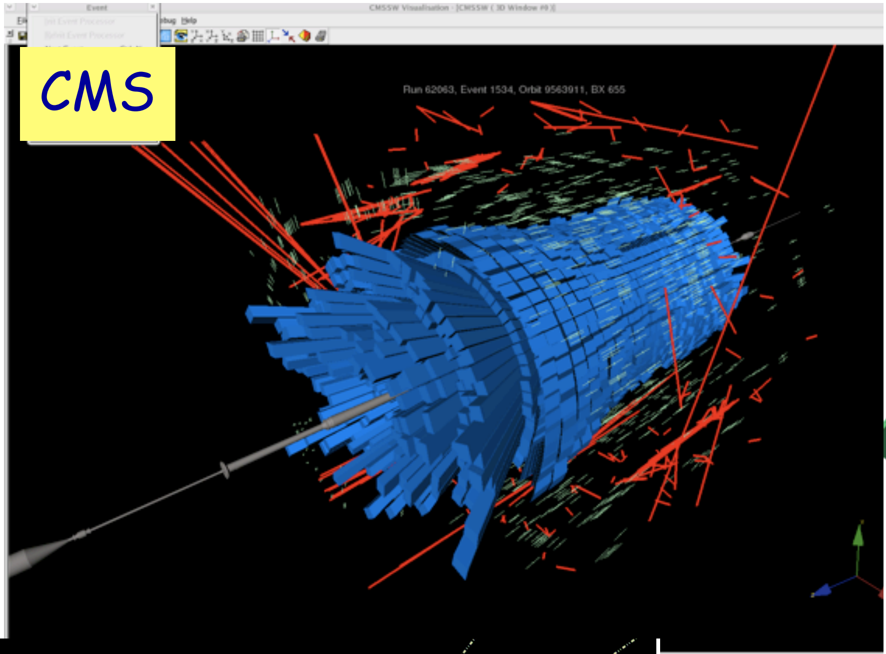
Atlas & CMS construction started 9 years ago

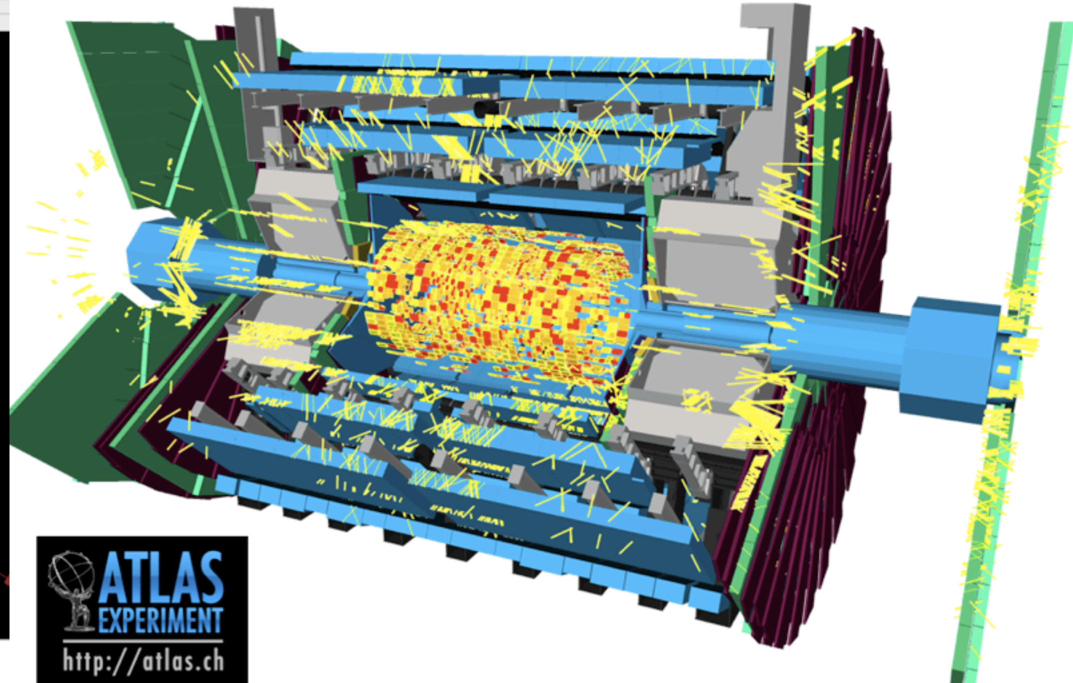
+TOTEM, LHCf, MOEDAL

Now gearing up for first collisions…

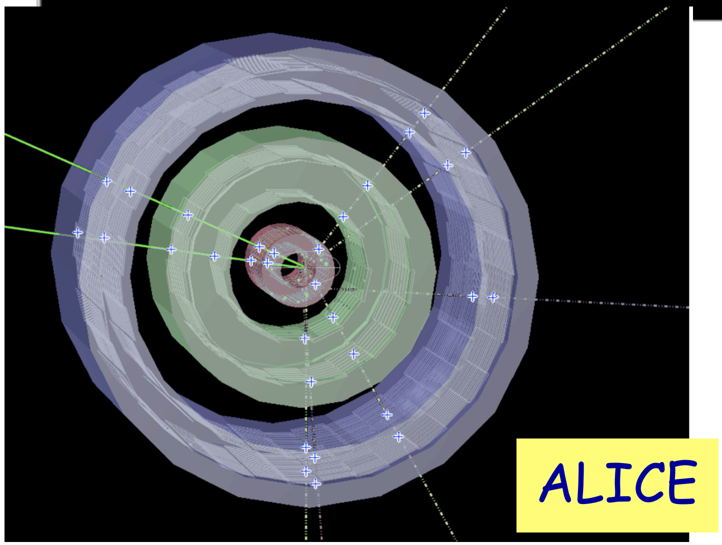
[redacted]

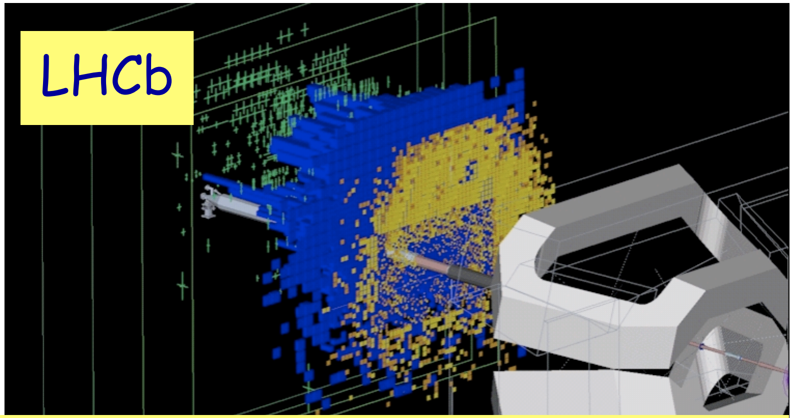
LHC Story: Beam Halo and Splashes on 10/9/08





first beam event seen in ATLAS

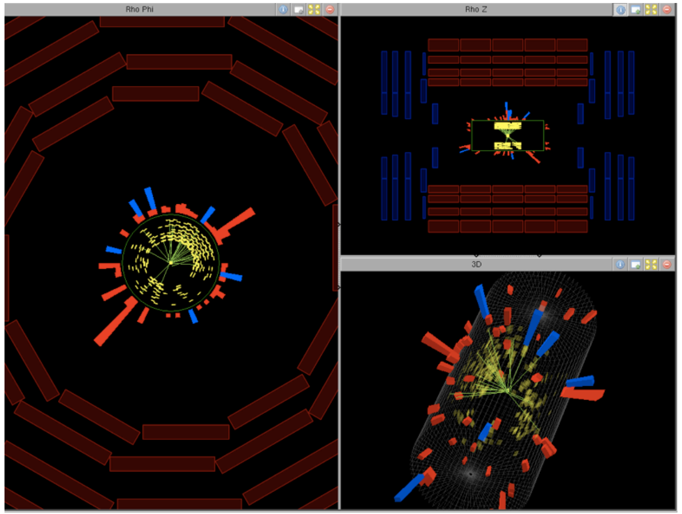


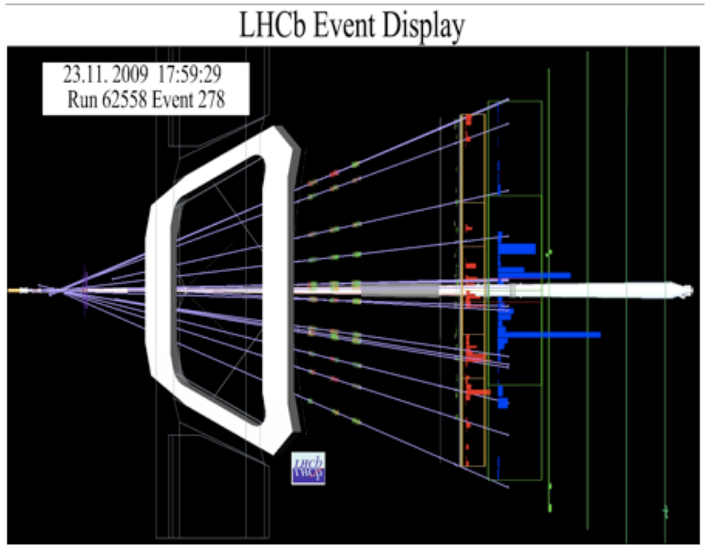


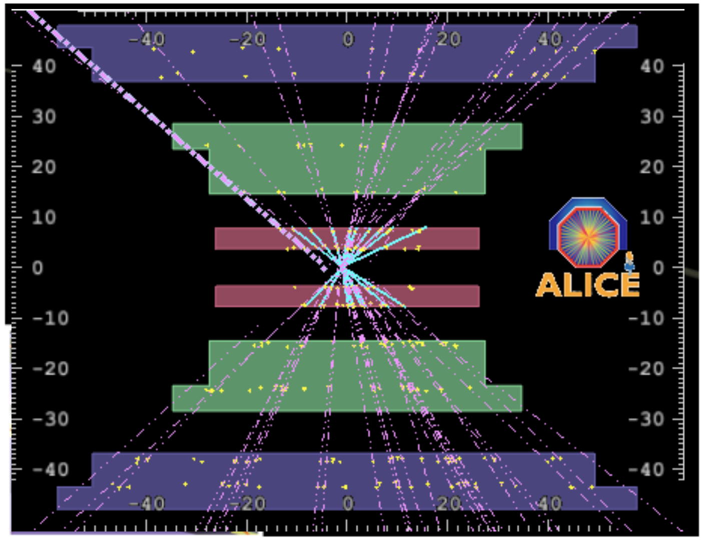
First LHC activity in the detectors in Sept. 2008, followed by the LHC accident

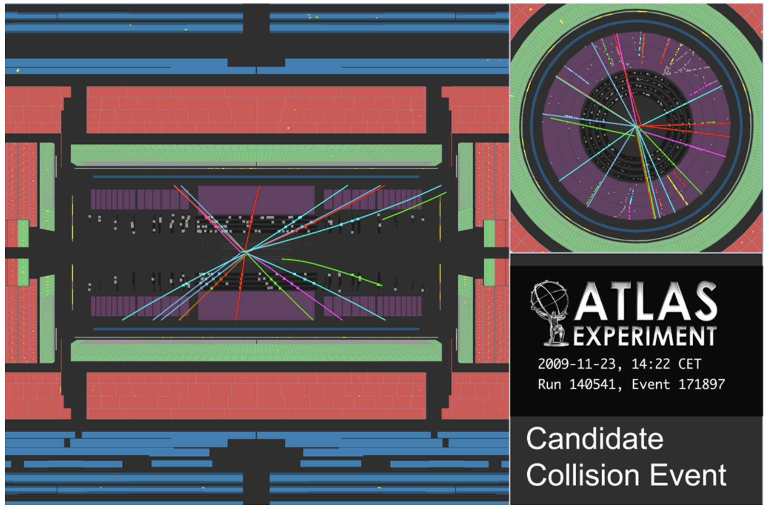
LHC Story: First Collisions in Nov. 2009

23/11 First ‘trial’ collisions in the experiments
A run with collisions at √s = 900 GeV or 2.36 TeV in December 2009





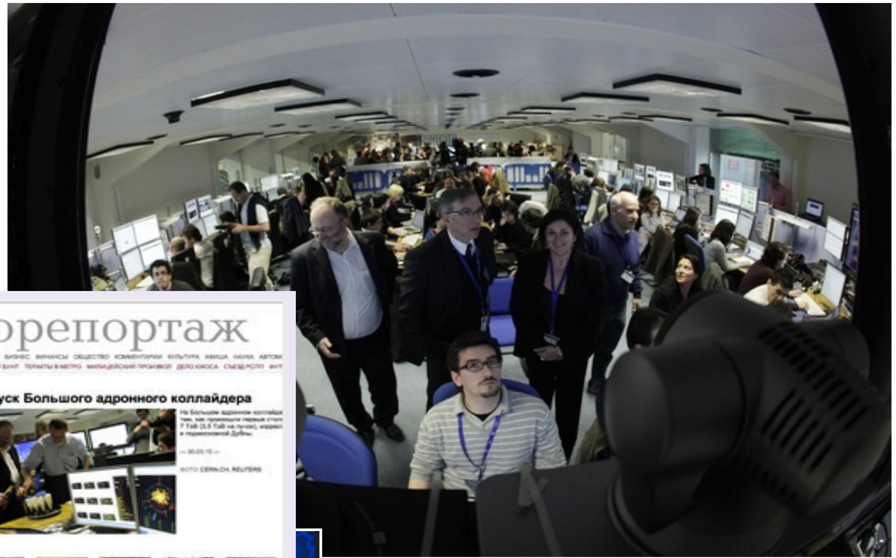




Key Moments

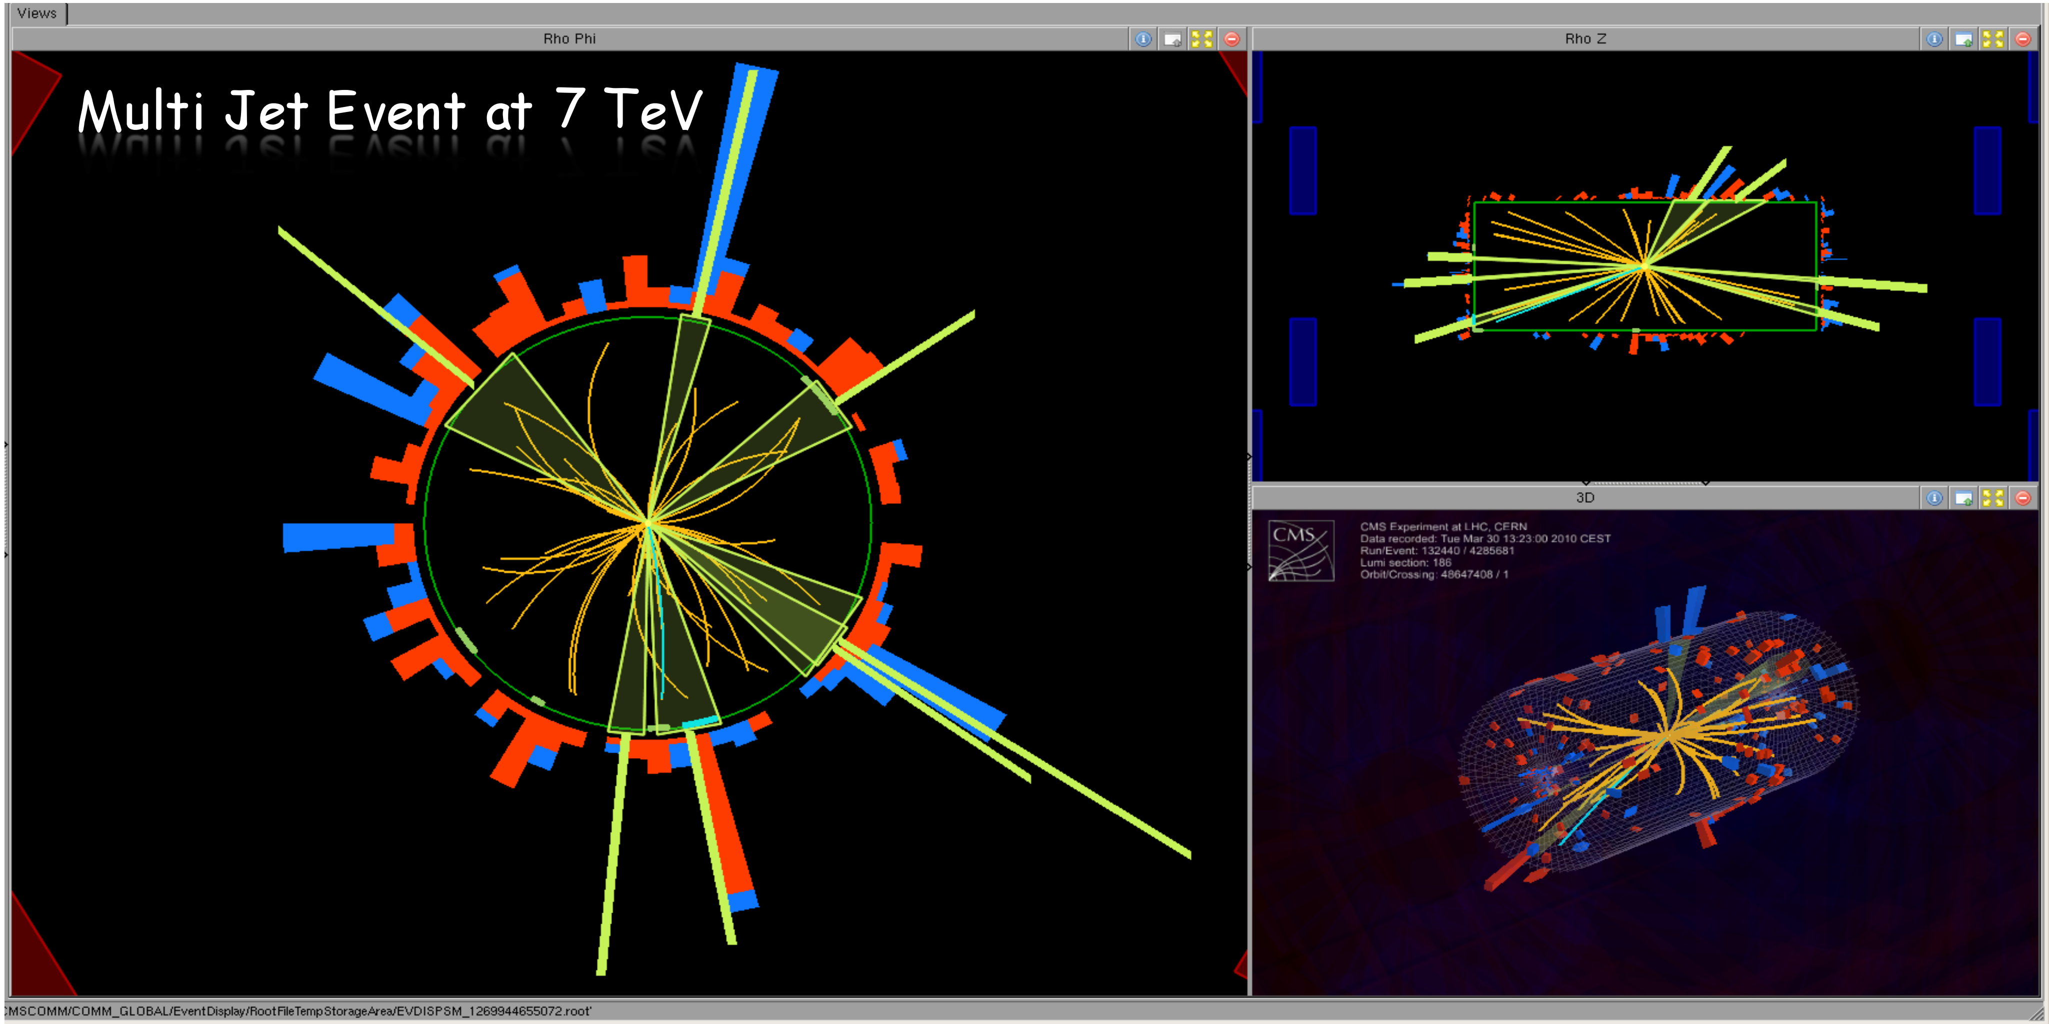
Some of the key moments the last years

30/3/10: Experiments are waiting for 7 TeV…

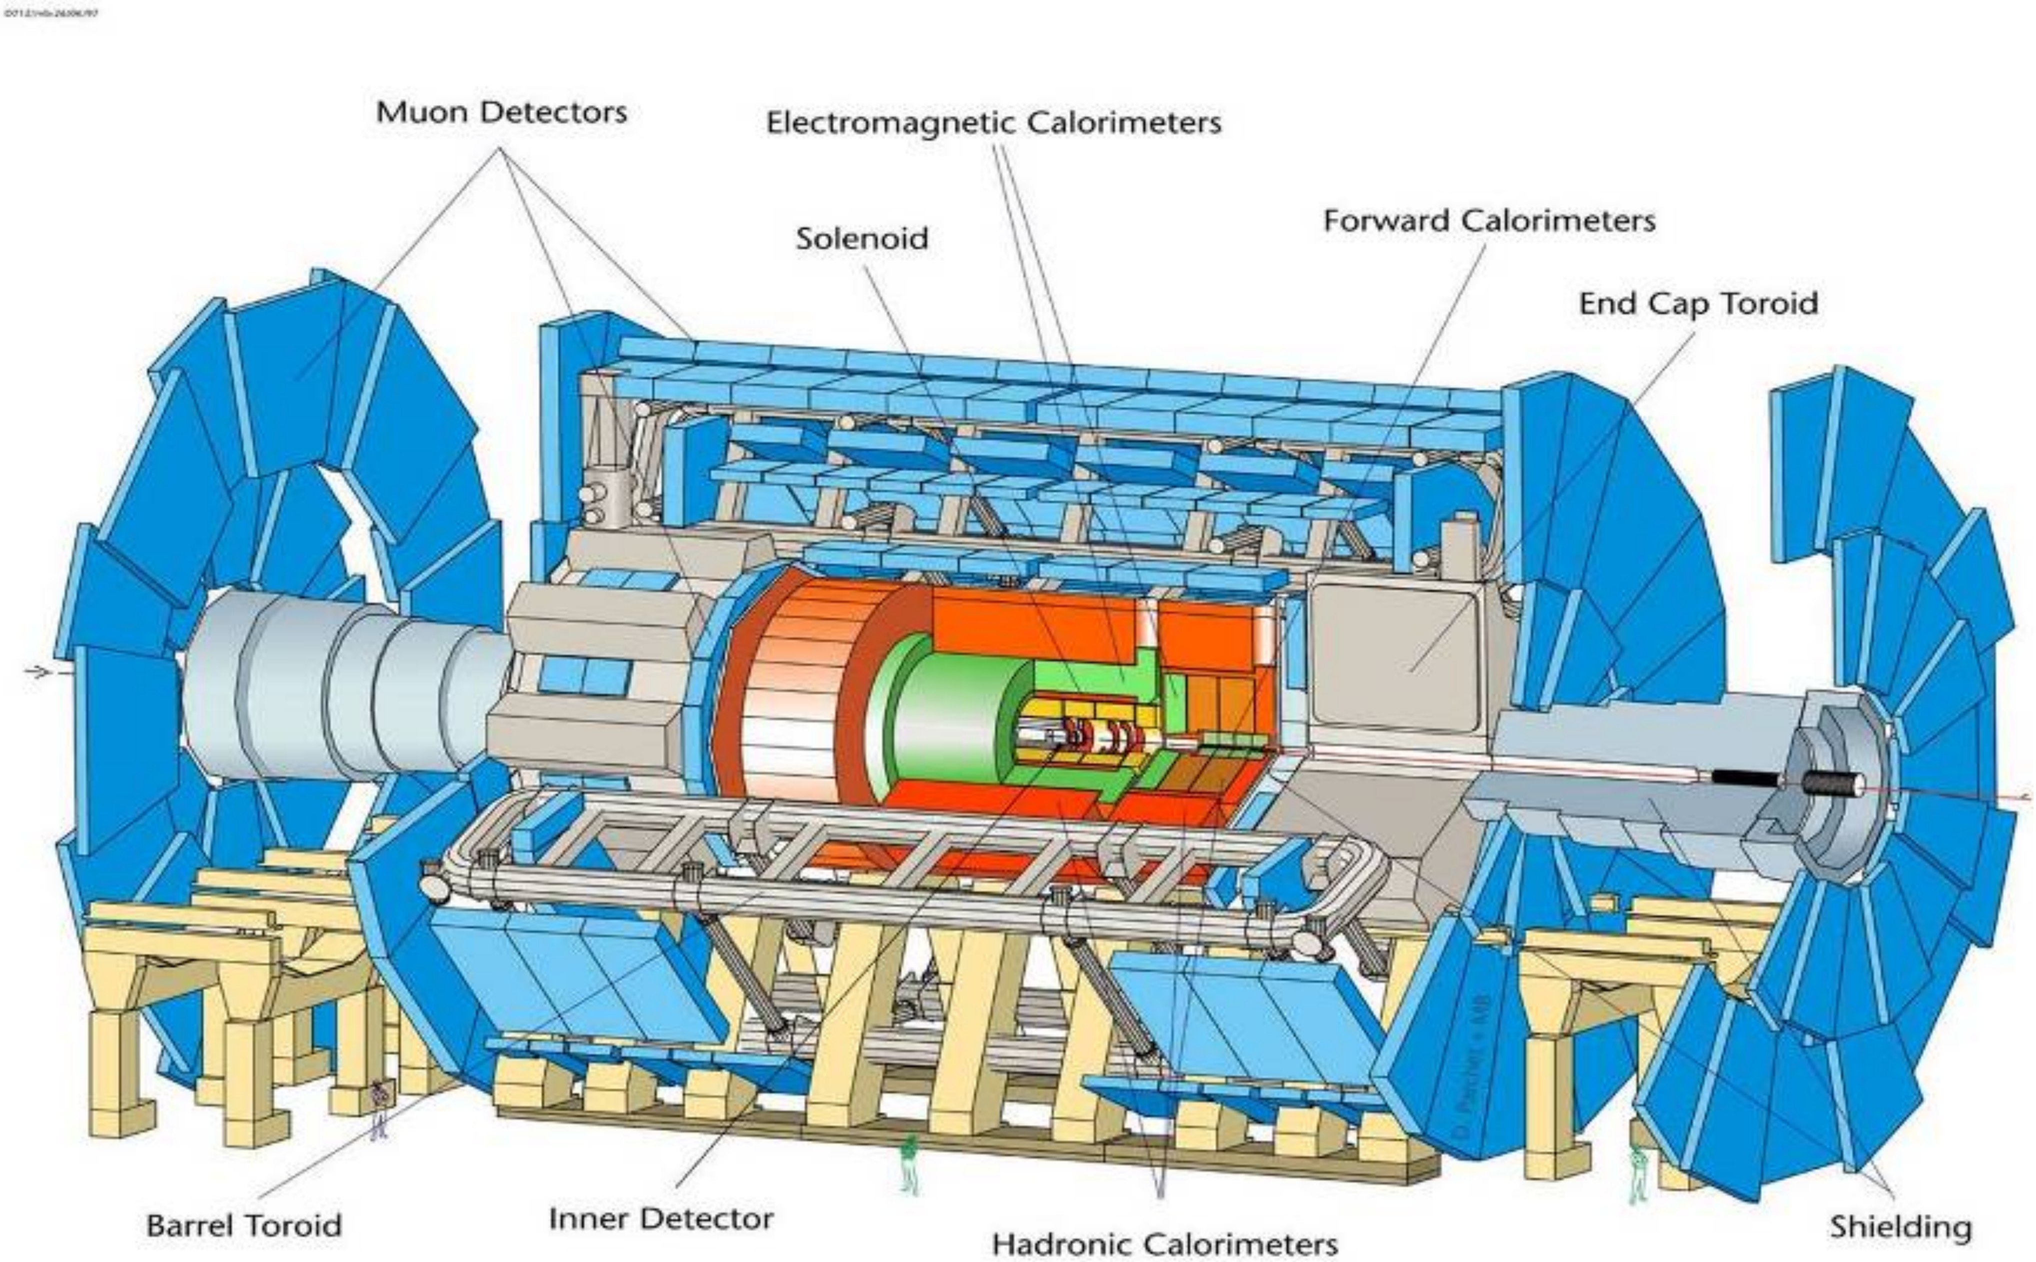


12:58
7 TeV collisions!!!

First Collisions at 7 TeV

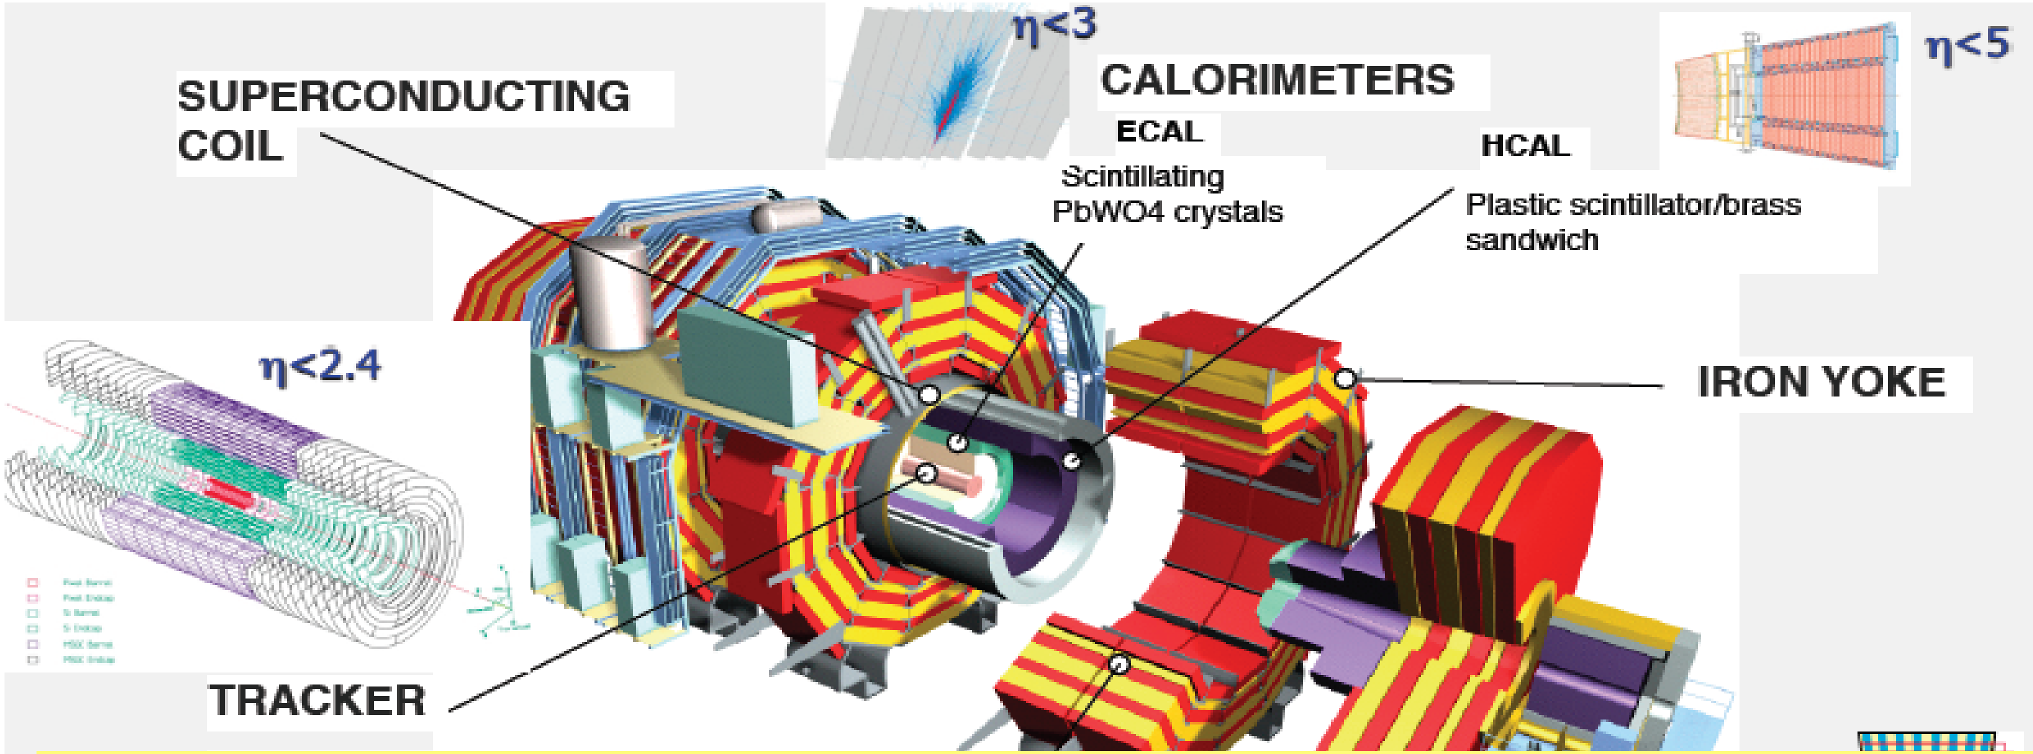


A Brave New World….



Length = 55 m Width = 32 m Height = 35 m but spatial precision ~ 100 μm

The Compact Muon Solenoid Experiment



In total about

~100 000 000 electronic channels

Each channel checked

40 000 000 times per second (collision rate is 40 MHz)

An on-line trigger selects events and reduces the rate from 40MHz to 100 Hz

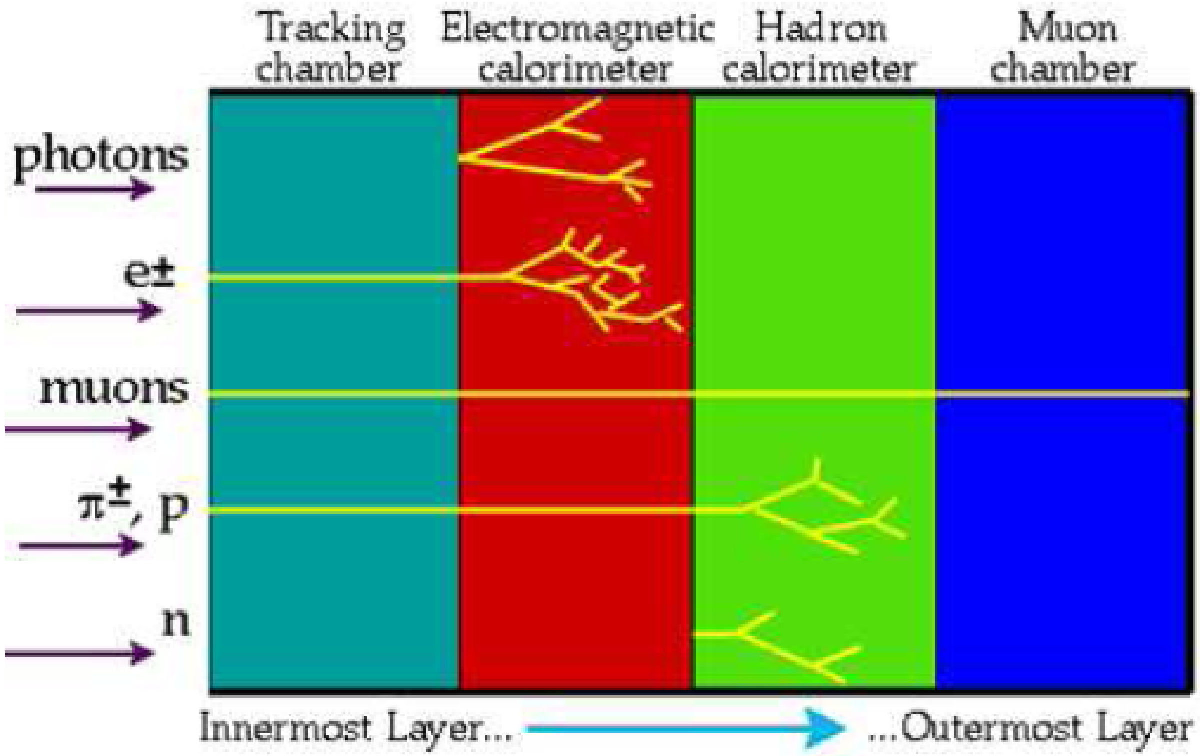
Amount of data of just one collisions

>1 500 000 Bytes

Detectors at Accelerators

Particle Detection: What we "see" as particles:

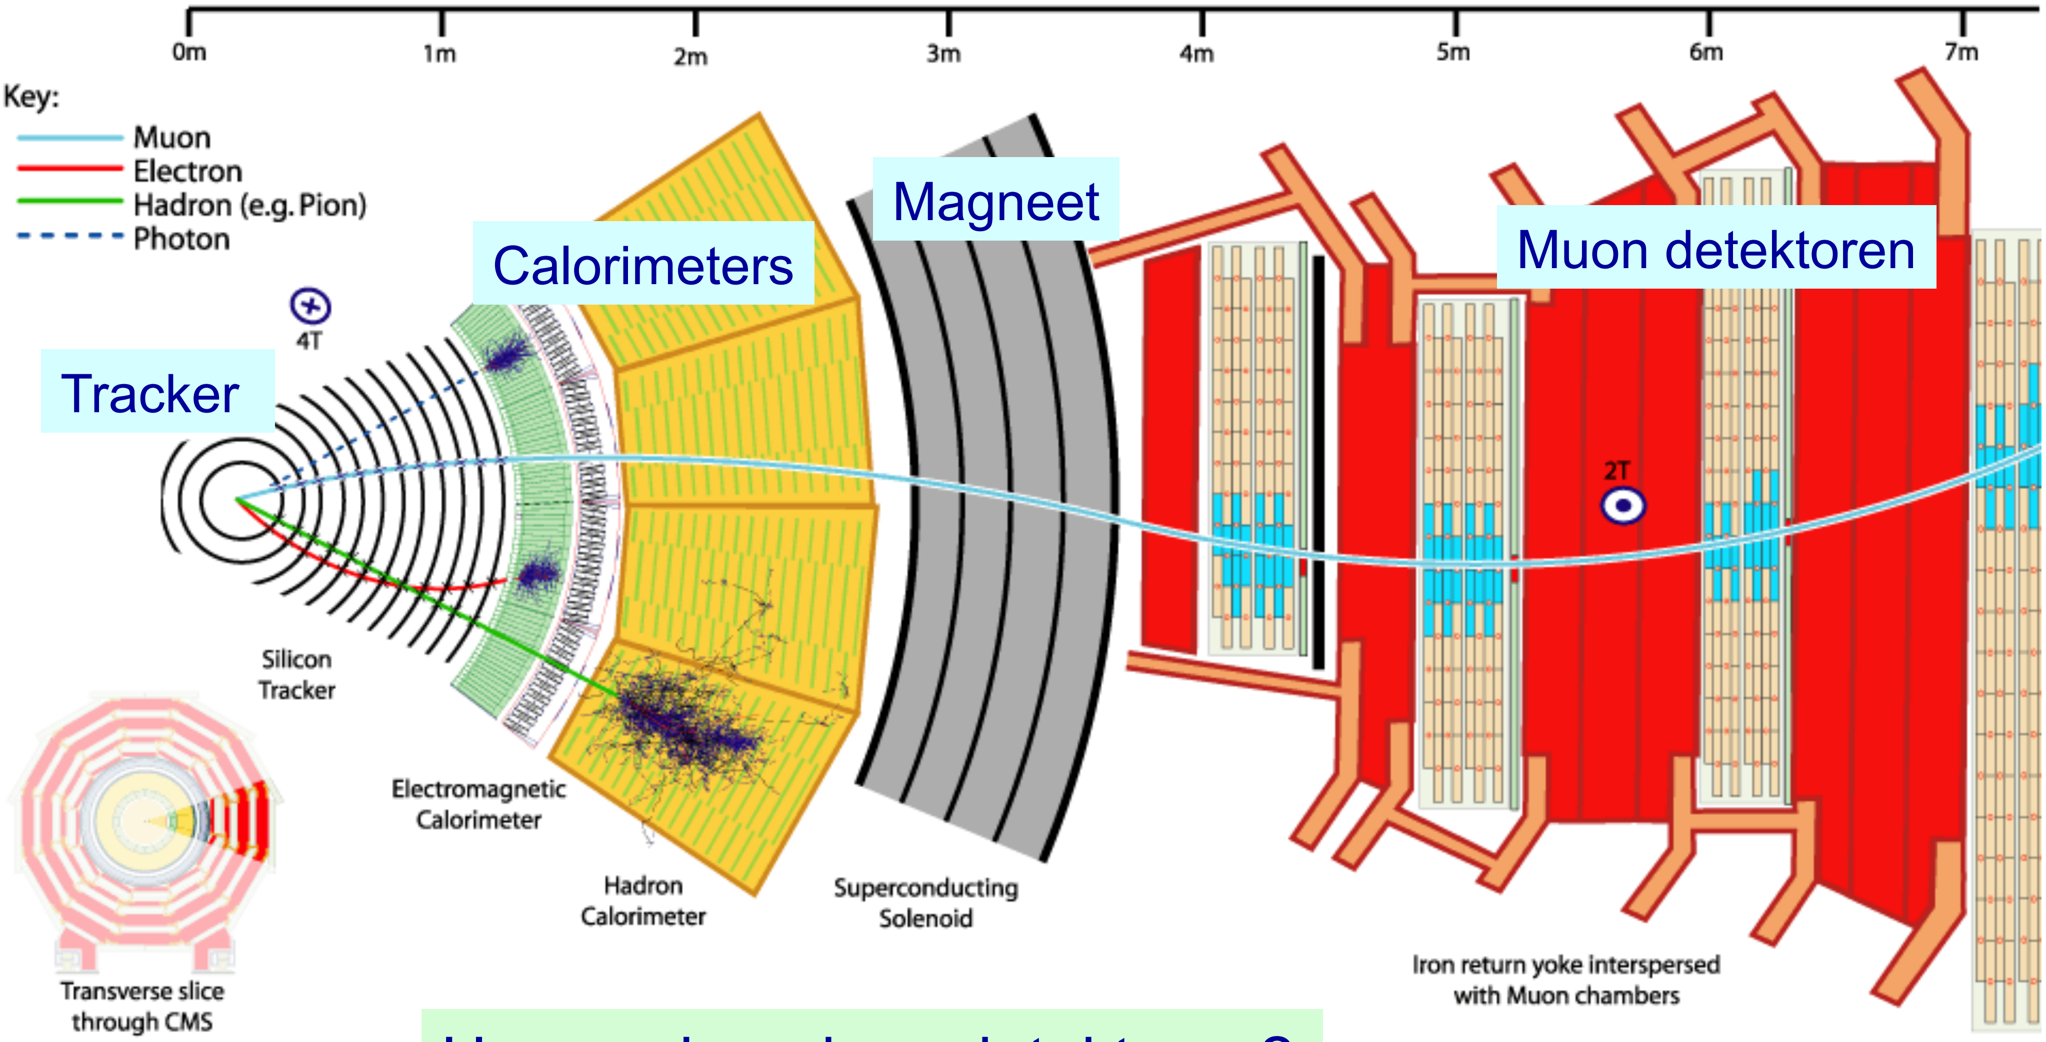
For "stable particles" of life time $\geq 10^{-10}$ s:



For charged tracks : $\Delta p/p \propto p$,

for calorimetry : $\Delta E/E \propto \frac{1}{\sqrt{E}}$.

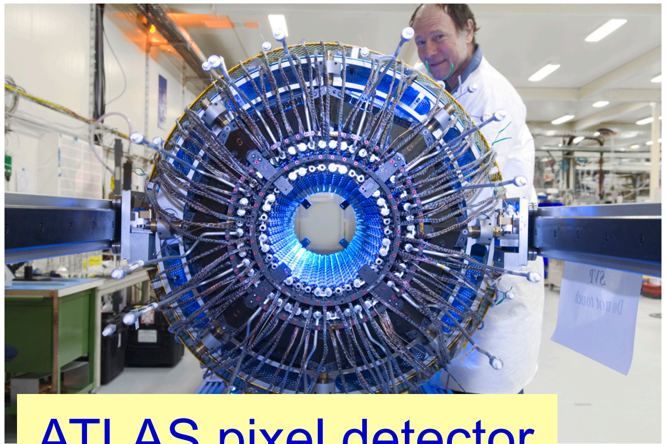
Particles in the detector



Hoe werken deze detektoren?
⇒ Lessen 2,3,4

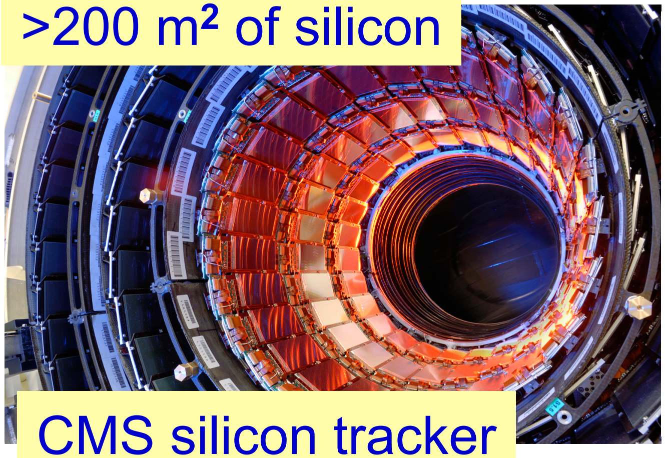
The LHC Detectors are Major Challenges

- CMS/ATLAS detectors have about 100 million read-out channels
- Collisions in the detectors happen every 25 nanoseconds
- ATLAS uses over 3000 km of cables in the experiment
- The data volume recorded at the front-end in CMS is 1 TB/second which is equivalent to the world wide communication network traffic
- Data recorded during the 10-20 years of LHC life will be about all the words spoken by mankind since its appearance on earth
- A worry for the detectors: the kinetic energy of the beam is that of a small aircraft carrier of 10^4 tons going 20 miles/ hour



ATLAS pixel detector

>200 m^2 of silicon



CMS silicon tracker

Object	Weight (tons)
Boeing 747 [fully loaded]	200
Endeavor space shuttle	368
ATLAS	7,000
Eiffel Tower	7,300
USS John McCain	8,300
CMS	12,500

CMS Solenoid

The largest high field solenoid magnet ever build!!

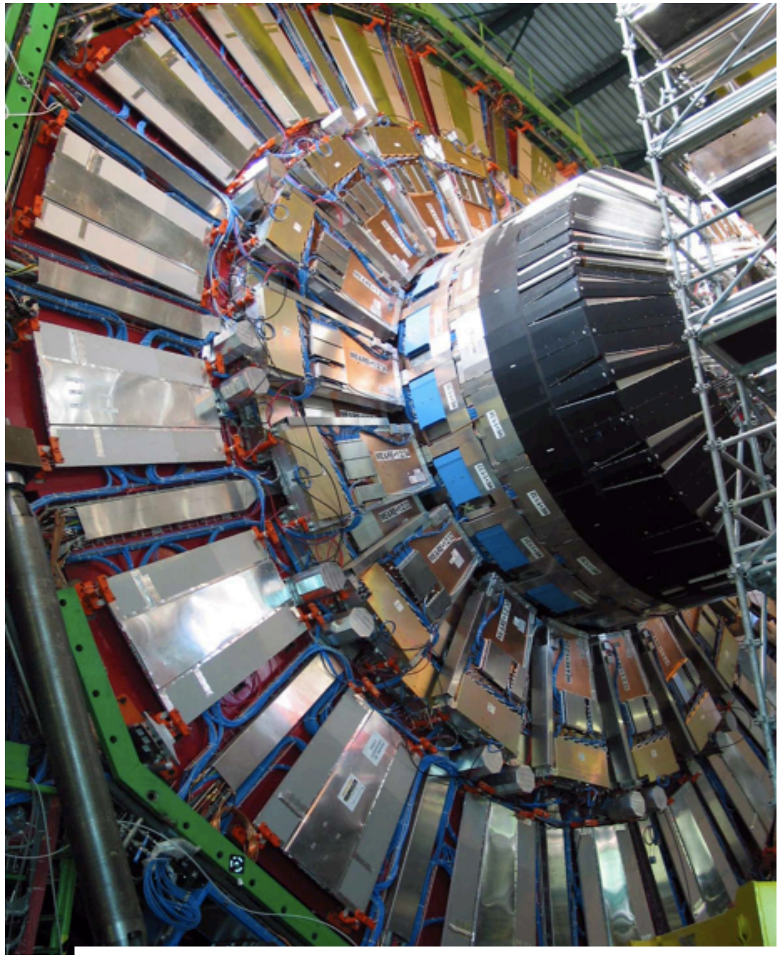
Successfully tested in August '06!!

Magnetic length	12.5 m
Free bore diameter	6 m
Central magnetic induction	4 T ≈100,000 times earth magnetic field
Temperature	4.2 degrees Kelvin ≈-269 degrees Celcius
Nominal current	20 kA
Stored energy	2.7 GJ
Magnetic Radial Pressure	64 Atmospheres

	CMS	ALEPH	factor

Construction of CMS (≥2002)

…In a large hall on surface

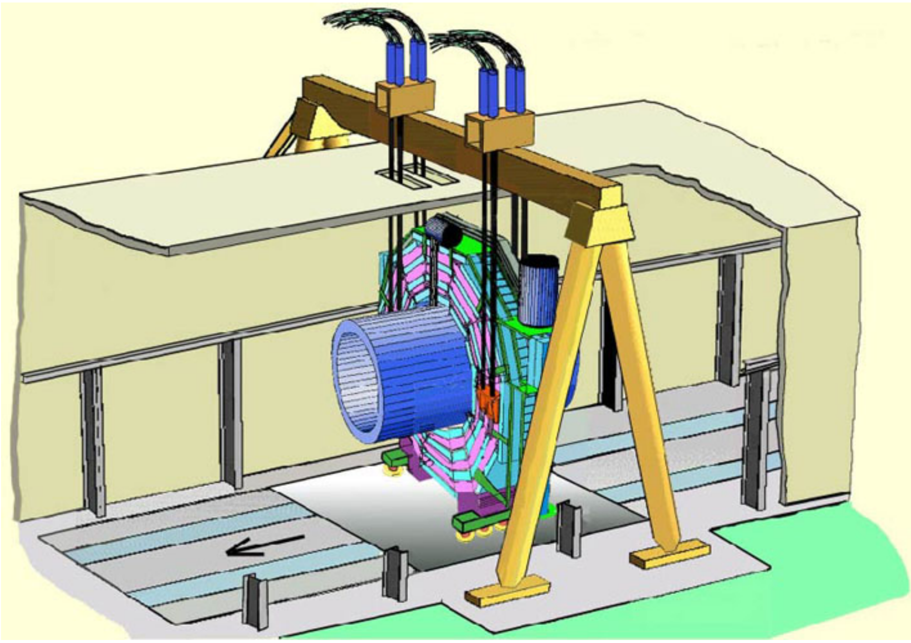


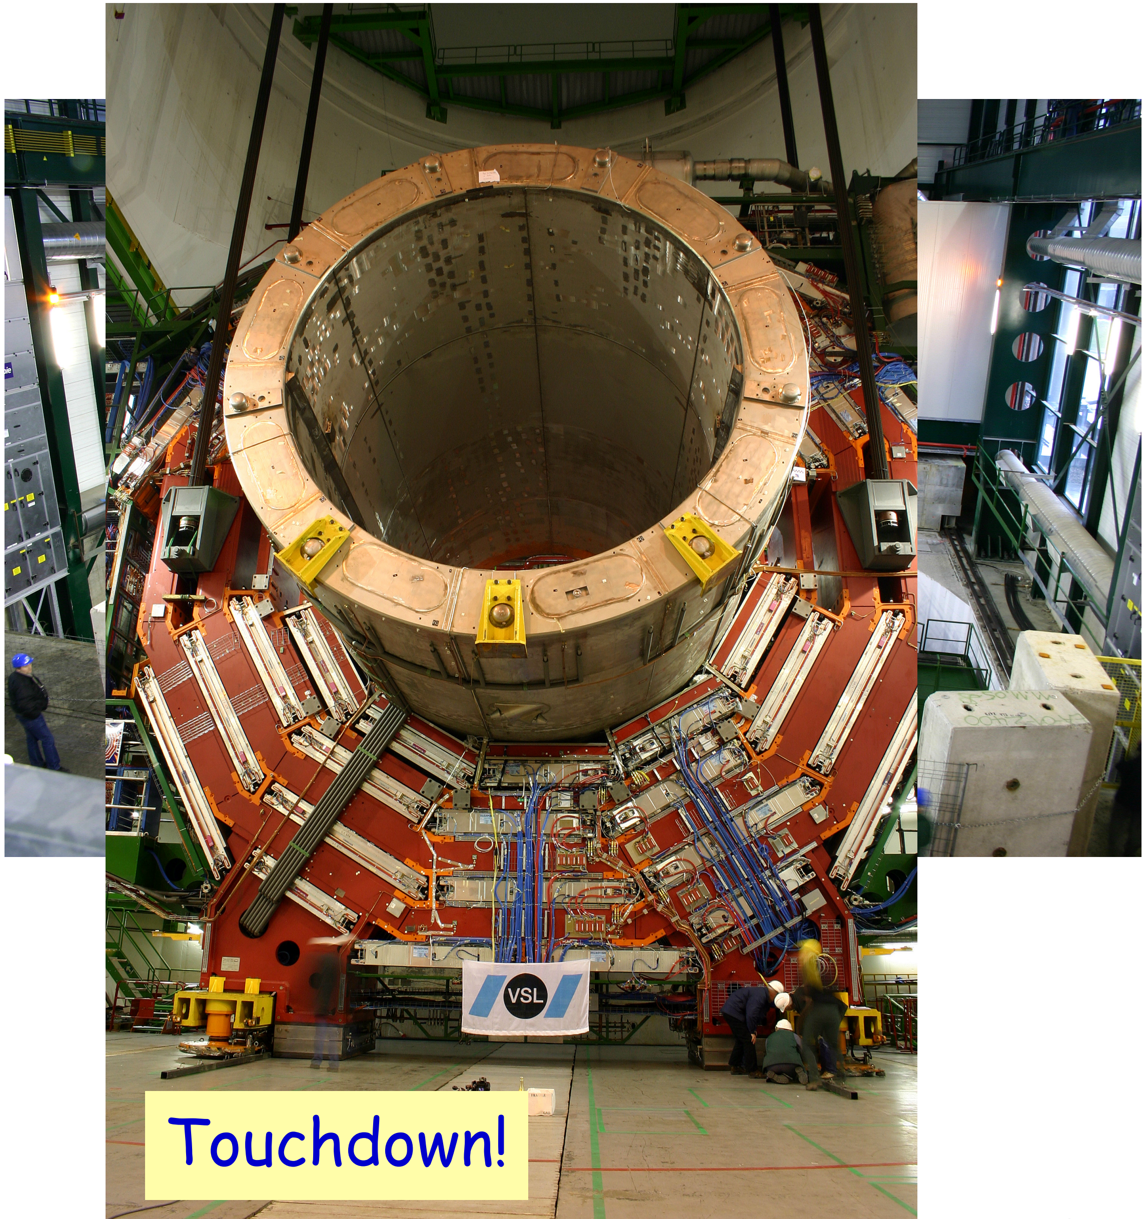
Muon detectors
832 000 read-out channels

Lowering of the Solenoid

The Central piece of CMS
⇒The barrel wheel with the solenoid

Total weight ~ 2Ktons
= 5 jumbo jets
Lowered February 28 (2007)

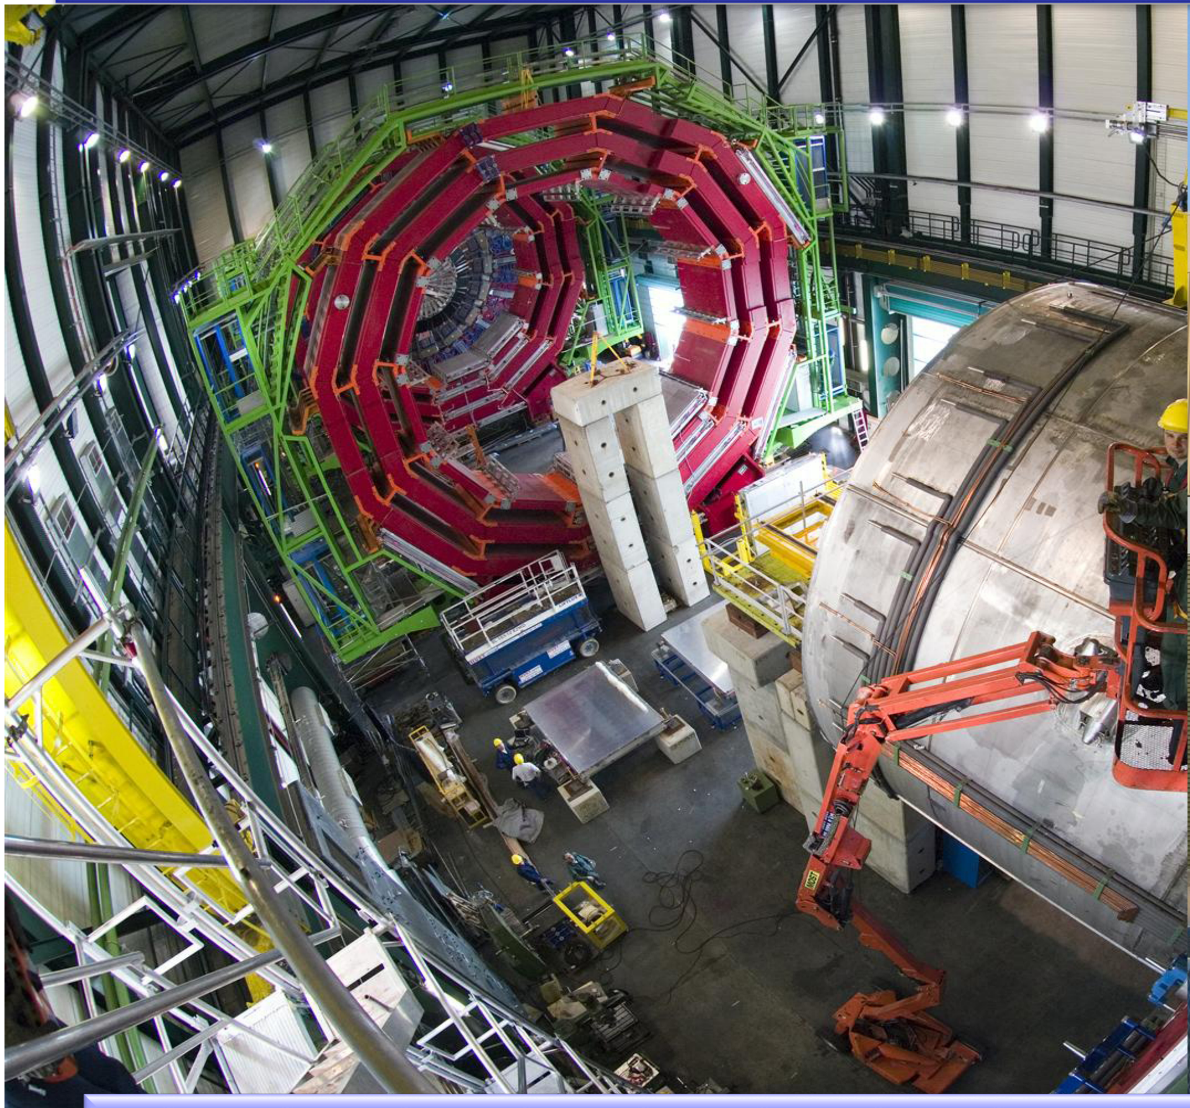




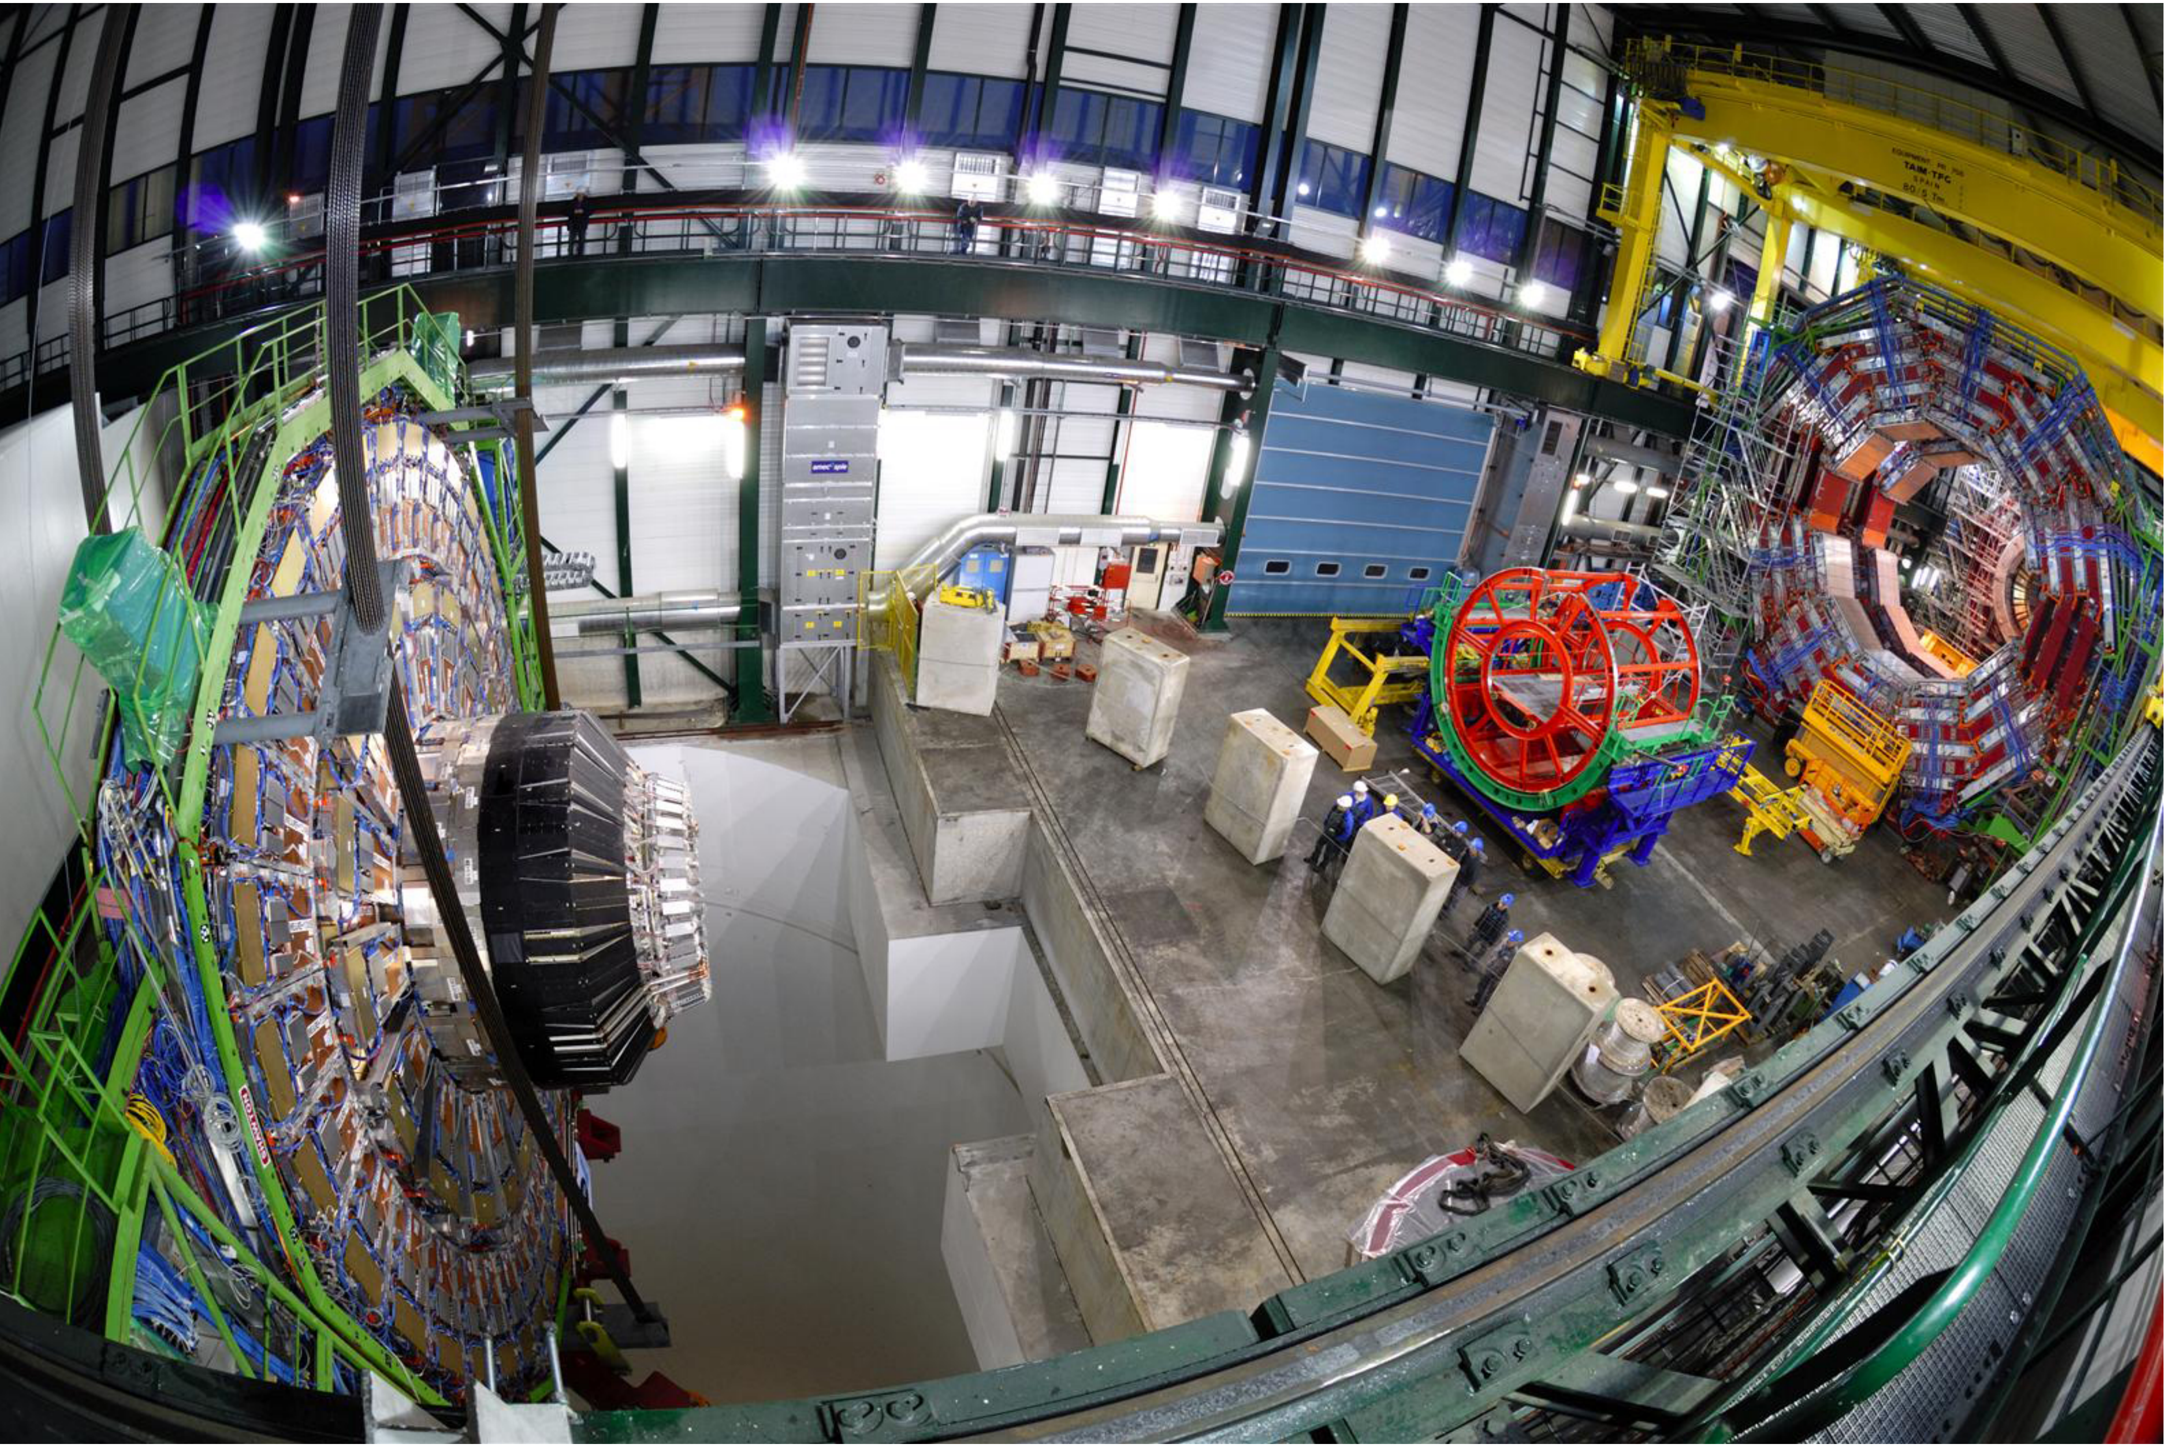
Lowering of CMS in the Underground Cavern

The first force CMS carefully studied was….. Gravity

CMS built on the surface and lowered in the cavern 100m below
Piece by piece over three years



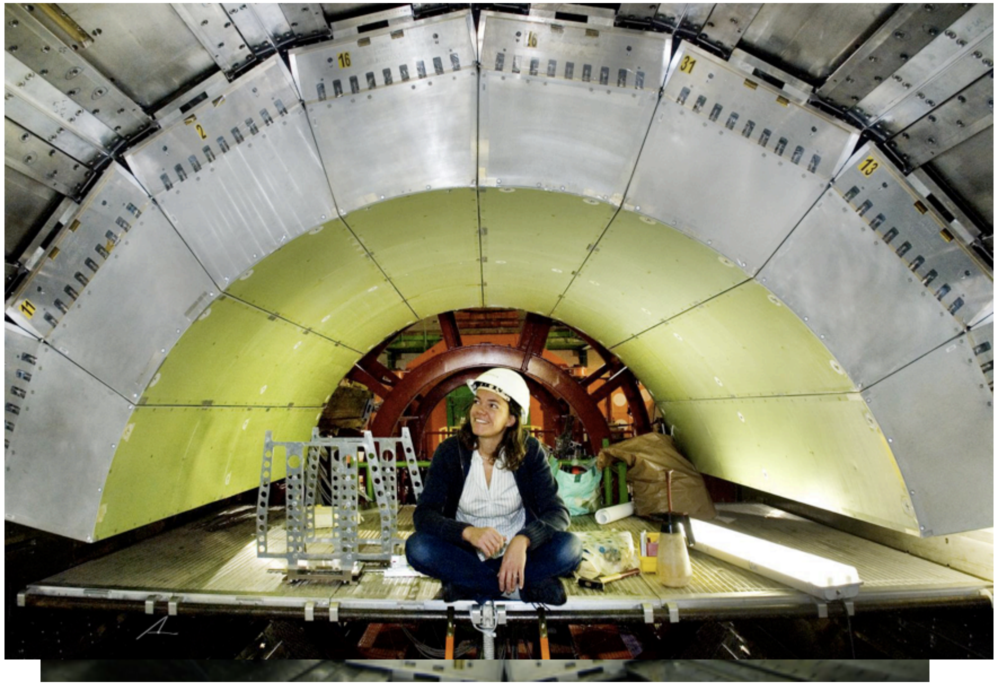
Hydraulic jacks and control tower used in CMS will be used in Durban to lift the roof of the stadium for World Cup 2010



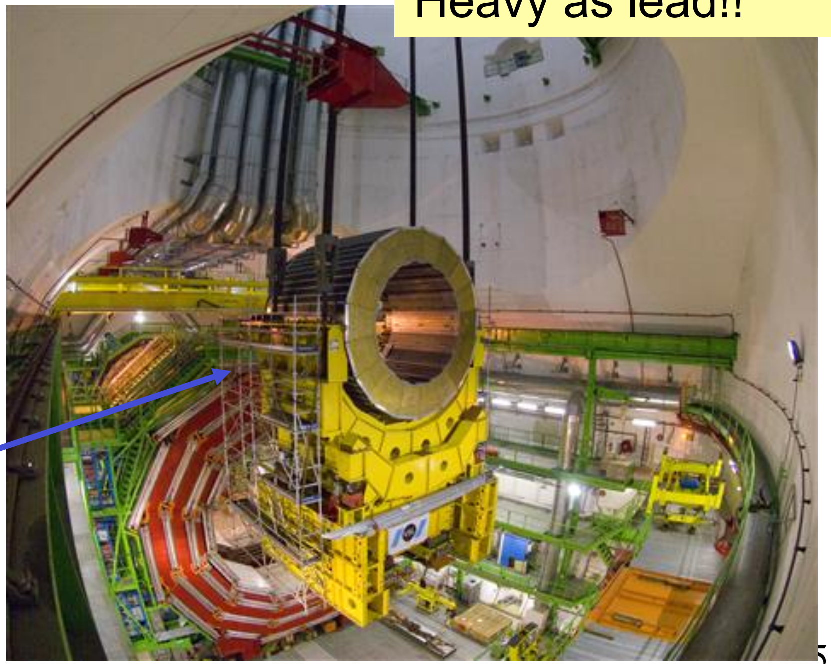
The CMS Detector: Calorimeters

ECAL: Barrel 36 super modules/1700 crystals
Endcaps detectors completed in summer 2008
Total of ~70000 crystals for this detector

Lead tungstanate.
Transparent like glass
Heavy as lead!!

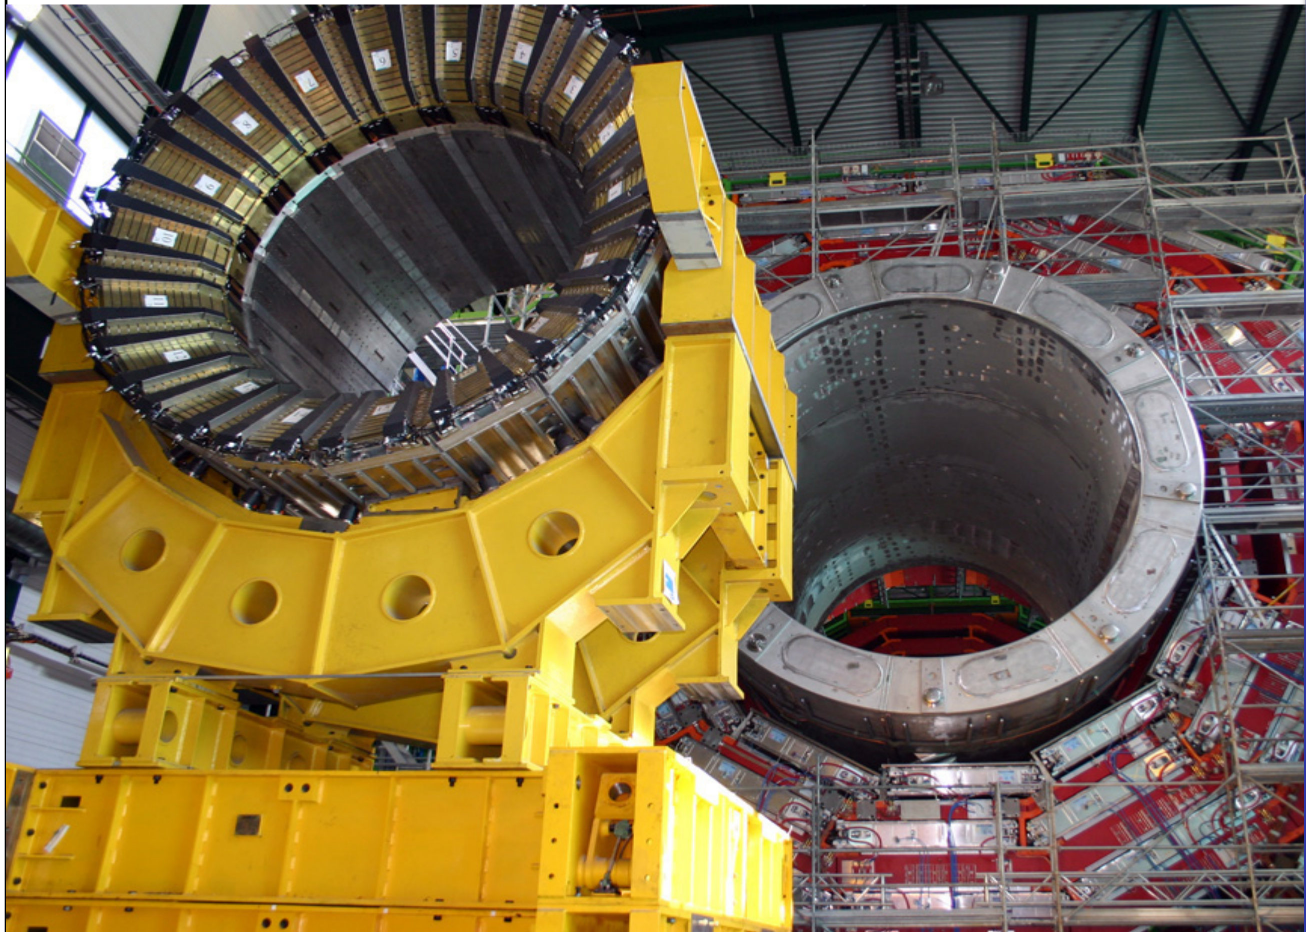


Central ECAL installation in CMS



Hadronic Calorimeter (brass/scintillator)
completed in 2006
Lowering in the experimental hall

Hadron Calorimeter (HCAL)



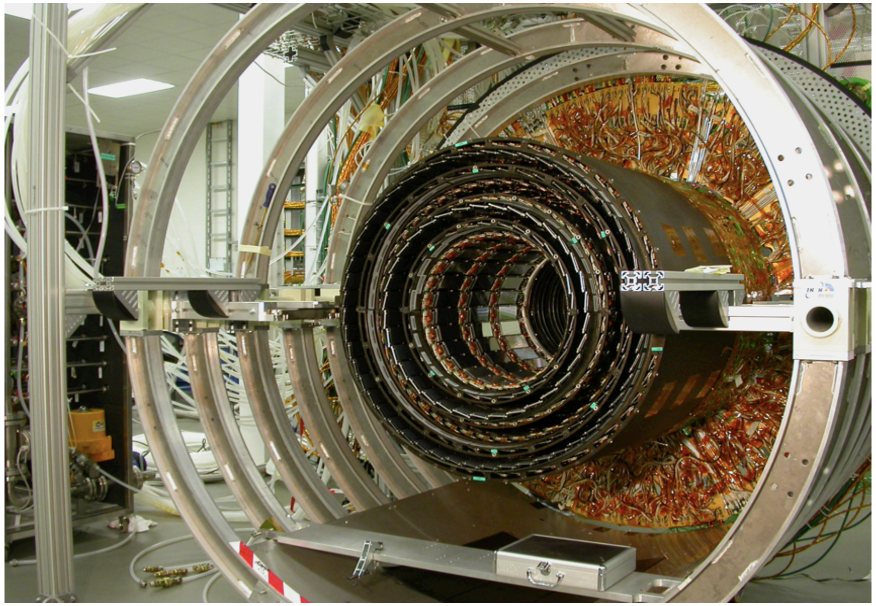
Made of dense brass layers interspersed with
 plastic scintilitaors

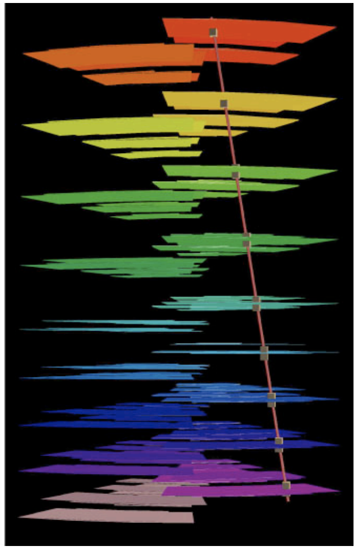
Used over a million World War II brass shell casements from the Russian Navy in making some of its detector components;
is made up of 36 wedges, each of which weighs as much as 6 African elephants;
contains over 400 “optical decoder” units, all of which were made by American high school students through the QuarkNet programme.

Function:

Measure energy of hadrons (protons, neutrons)

The CMS Central Tracker

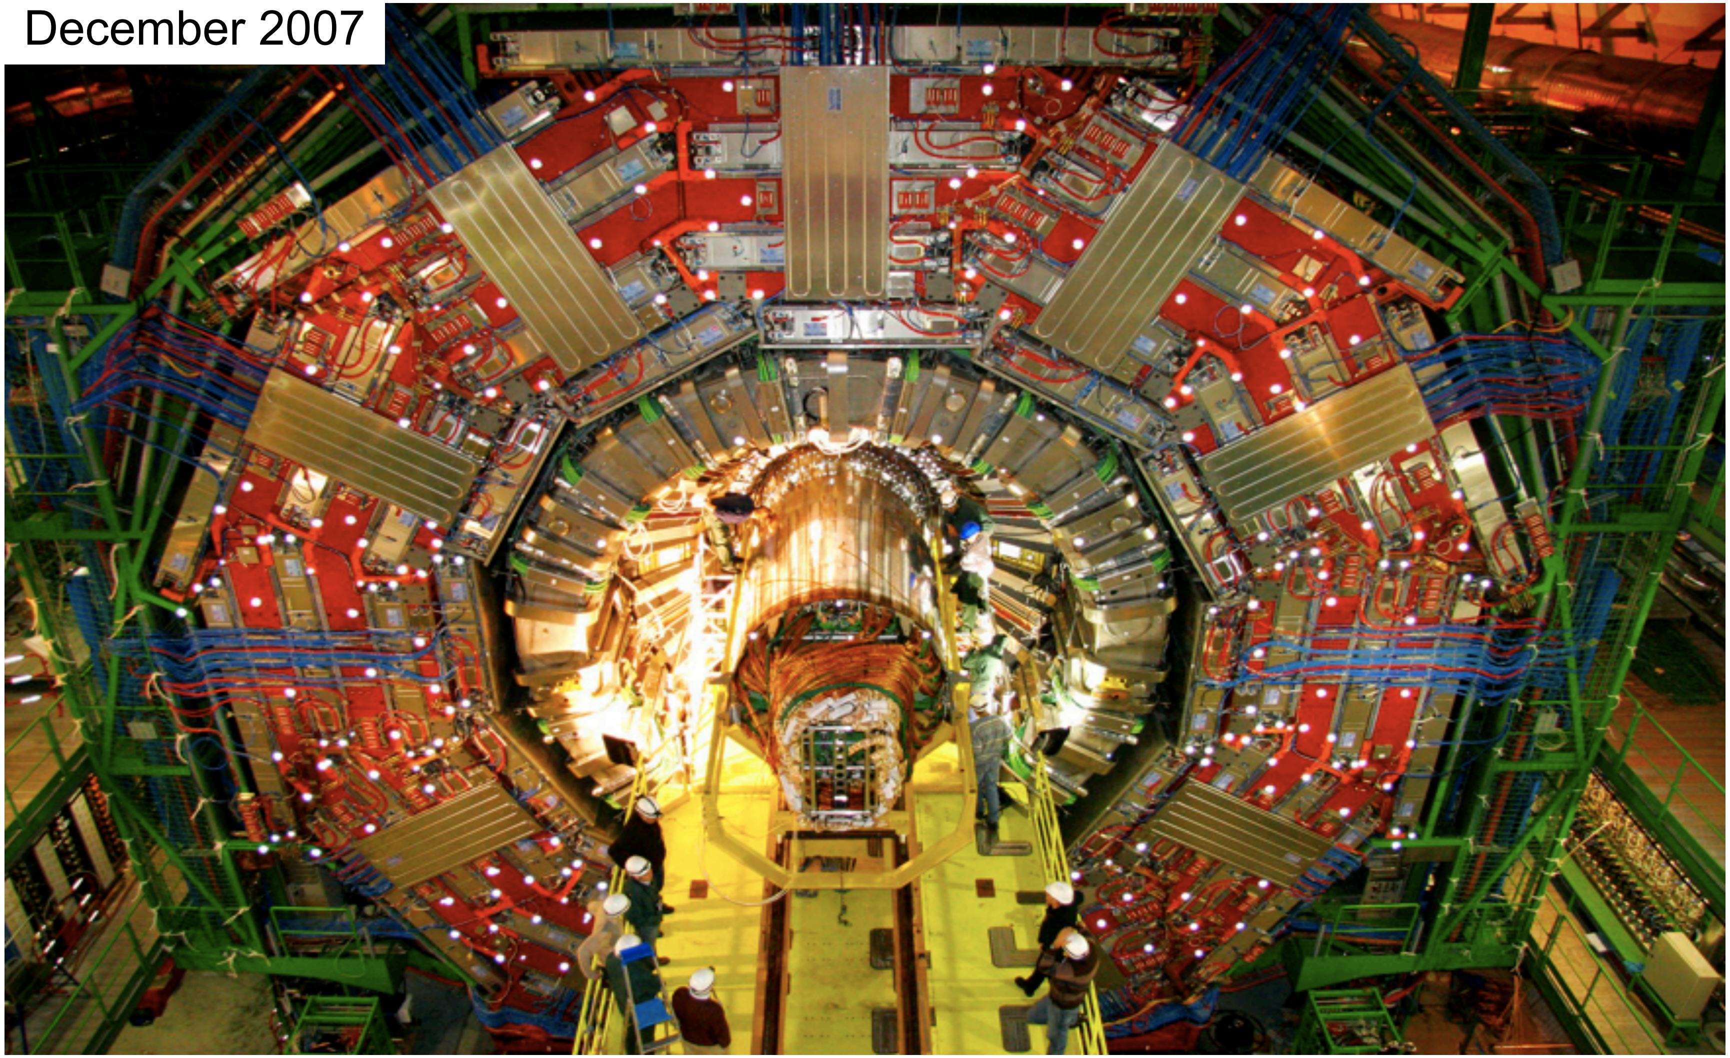




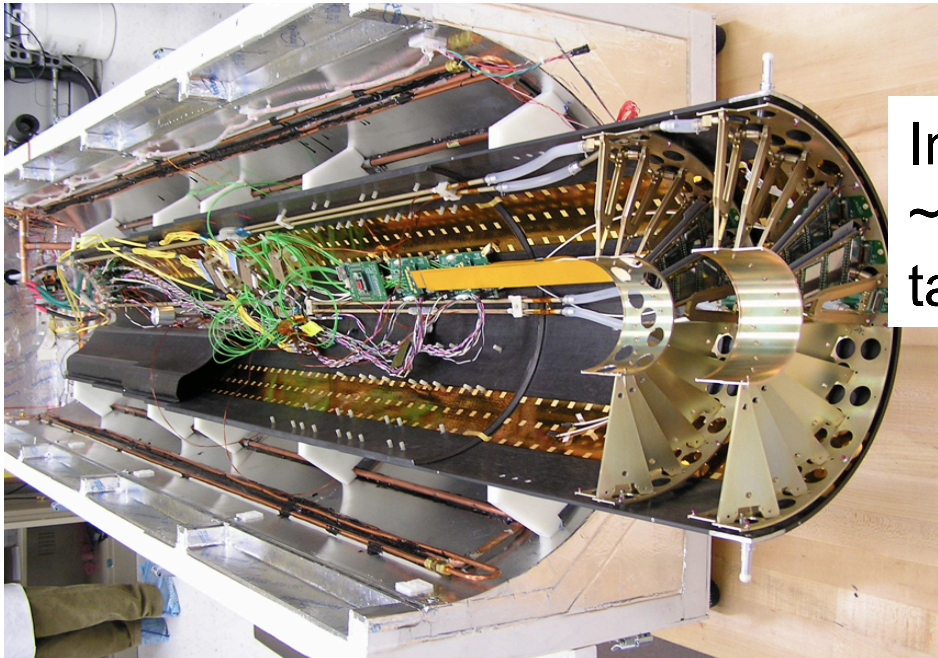
- 200 m^2 silicon detectors (~ tennis court)
- ~ 10^7 read-out channels: silicon strips

Installation of the Central Tracker in CMS

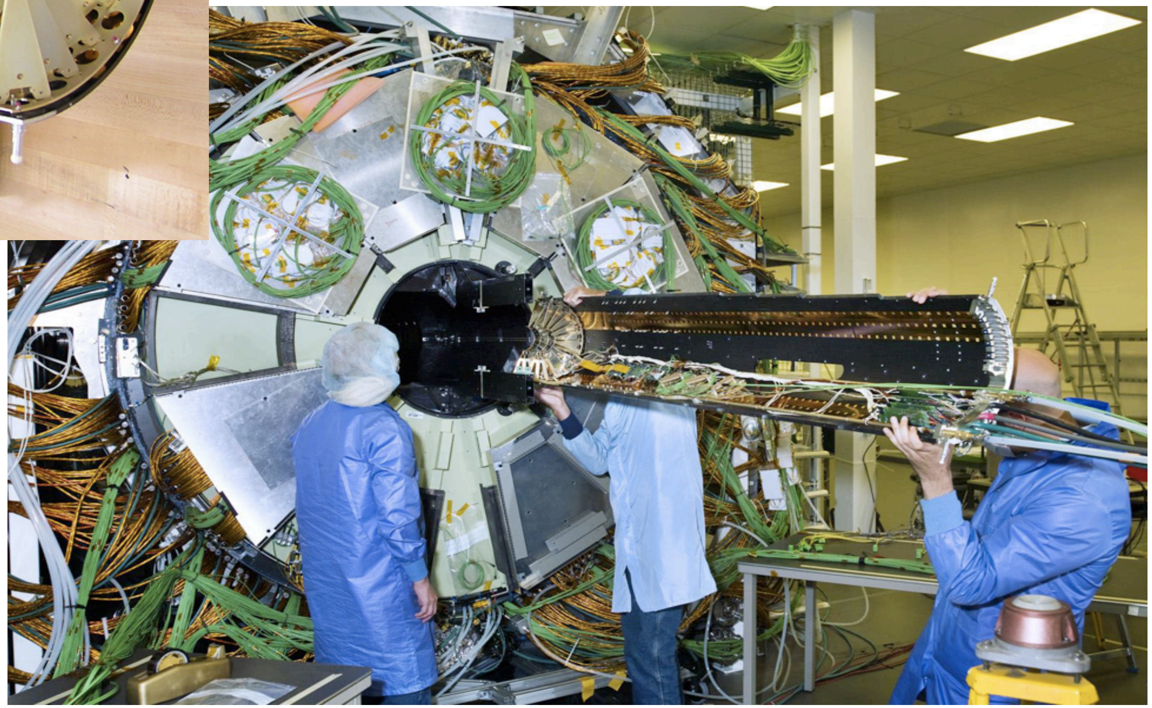
December 2007



Pixel Tracking Detector

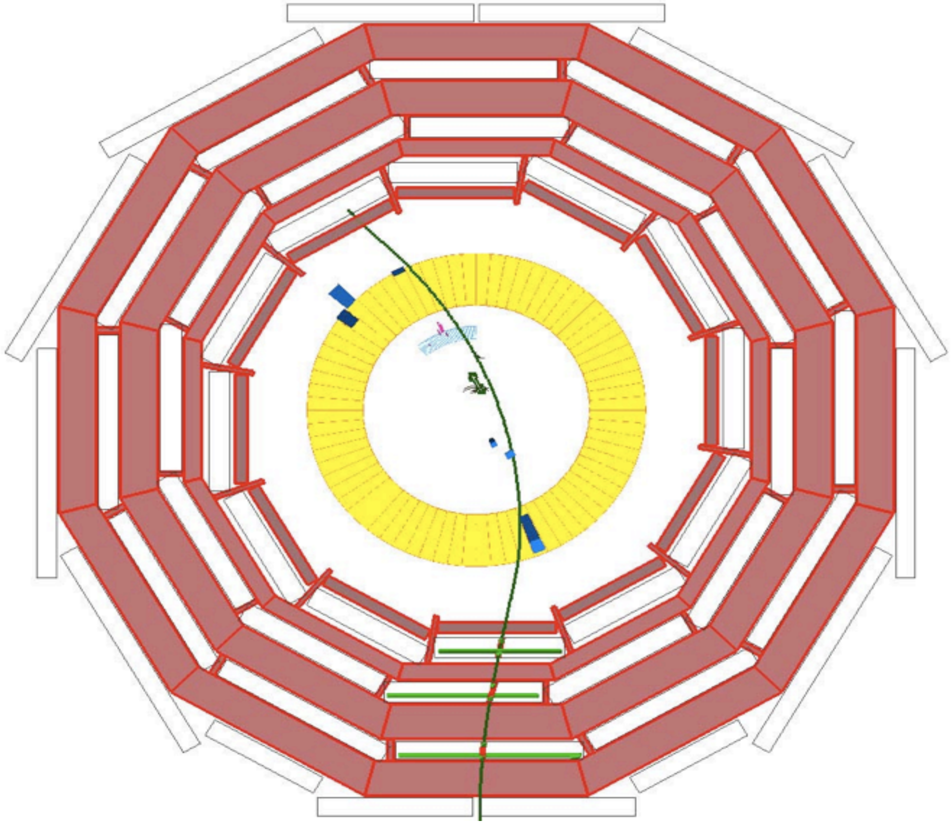


In total 7.10^7 read out channels
~ photo camera with 70 milion pixels
taking 40 million photos per second!!

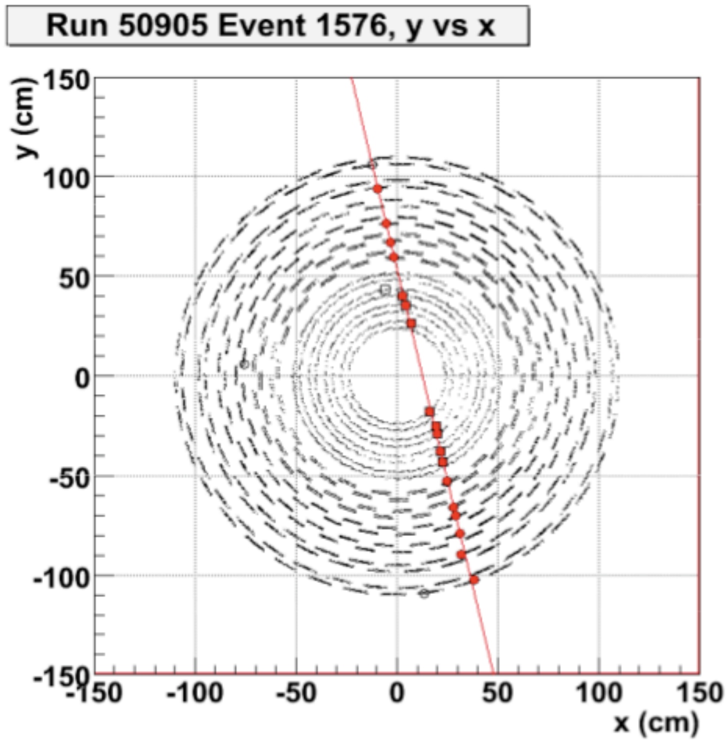


CMS Works! …
Example: Recorded Cosmic Muons

Muons recorded by a part of CMS (2-5%) during the summer of 2006



Muons recorded by the complete central tracker during the summer ‘08



The LHC Data Challenge

The LHC accelerator will run for 10-15 years

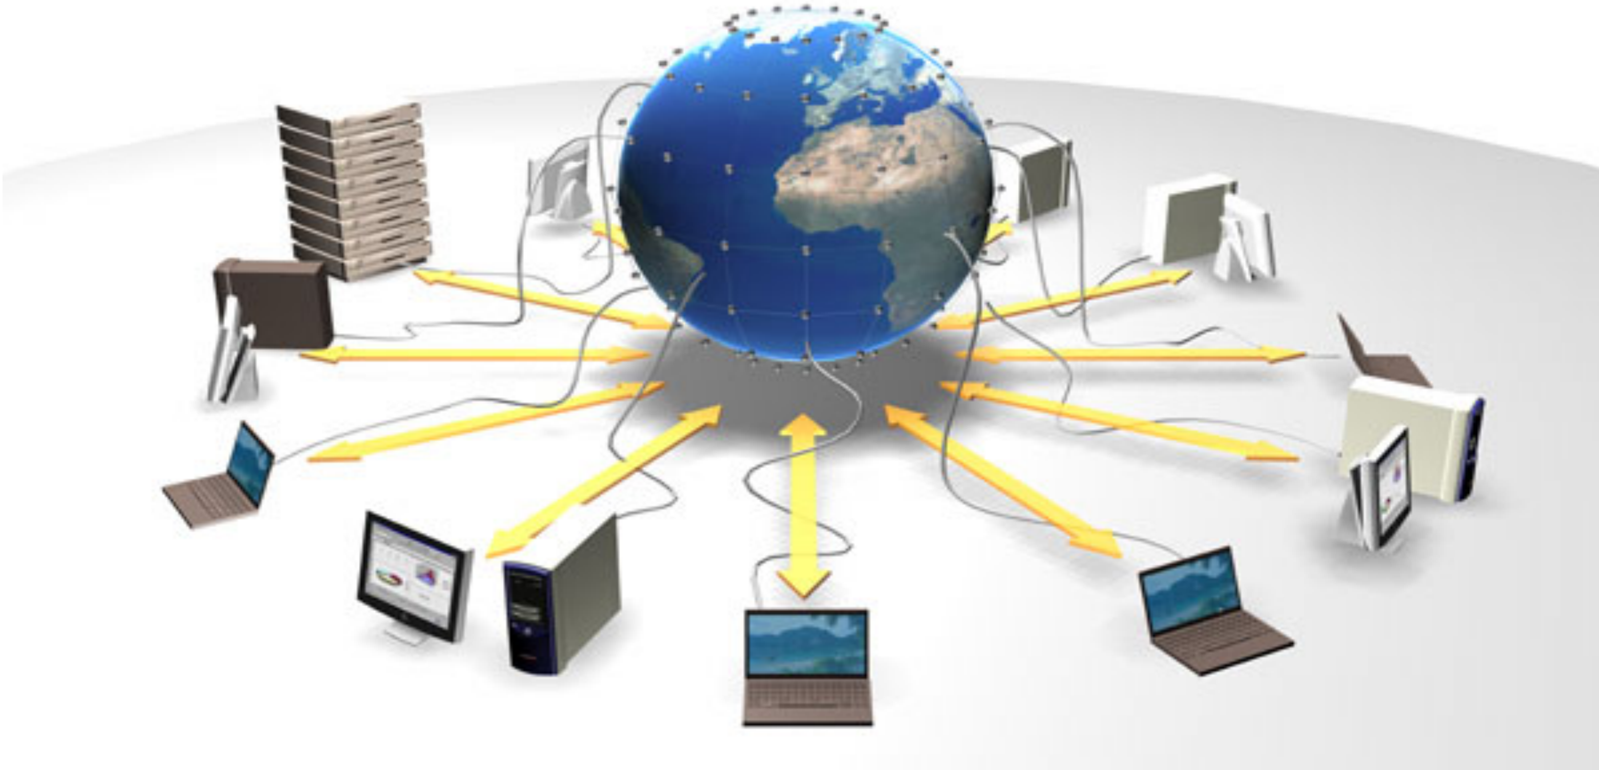
Experiments will produce about **15 Million Gigabytes** of data each year (about 20 million CDs!)

LHC data analysis requires a computing power equivalent to **~100,000 of today's fastest PC processors**

Requires many cooperating computer centres, as CERN can only provide ~20% of the capacity

The LHC computing challenge

furthest reaching computer in the world...



Tens of thousands of computers based all over the world are used to analyse data from CERN. The computing GRID is the next advance in decentralised computing from the laboratory that brought you the World-Wide Web.

.

LHC Computing Grid project (LCG)

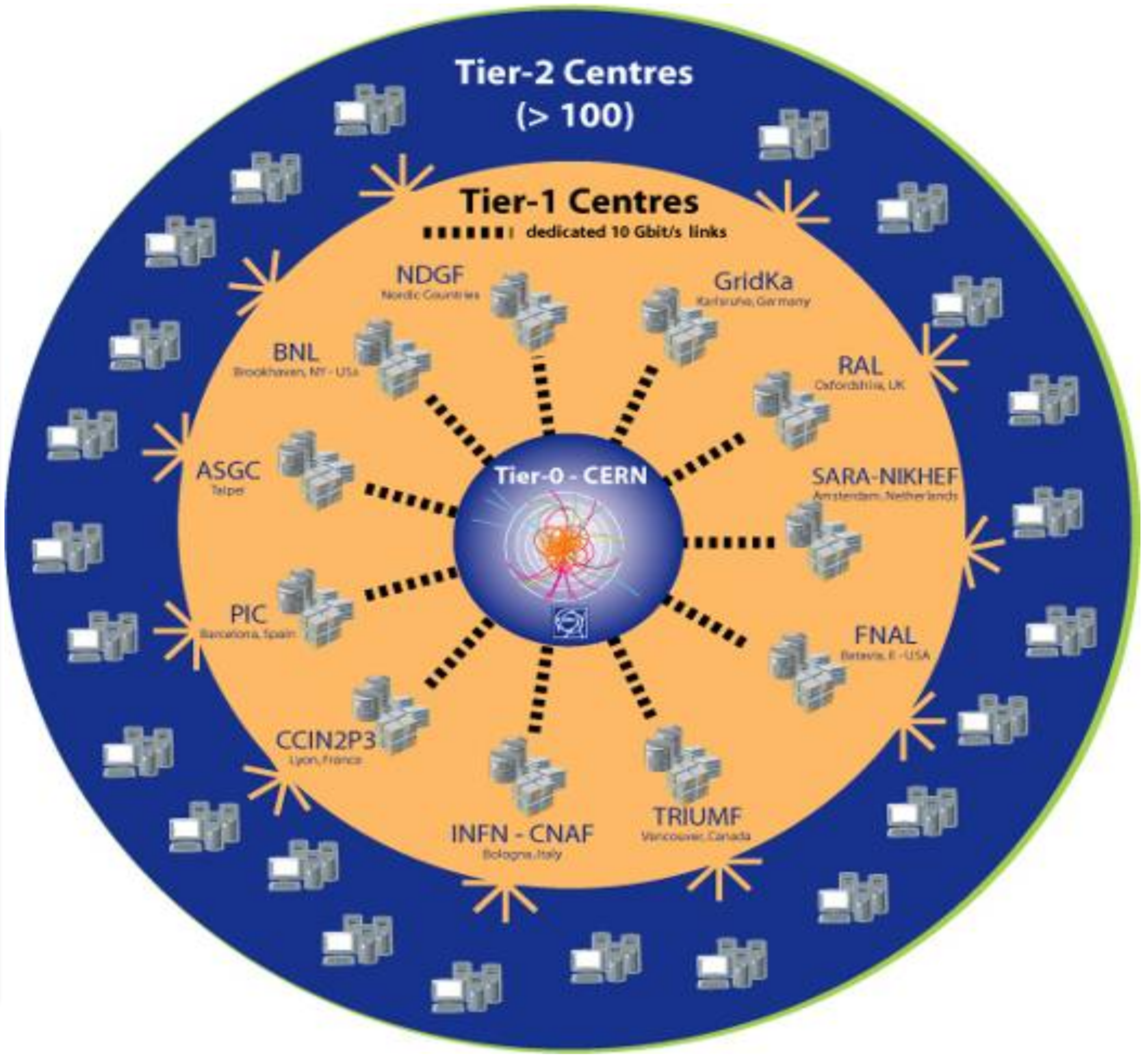
More than 140 computing centres
12 large centres for primary data management:
CERN (Tier-0)

Eleven Tier-1s

38 federations of smaller Tier-2 centres

India – BARC, TIFR, VECC

35 countries involved



The Science of the LHC

$\Rightarrow$ Explore the new high energy regime: The Terascale

The Origin of Mass

Some particles have mass, some do not

Where do the masses come from ?

Newton:

Weight proportional to Mass

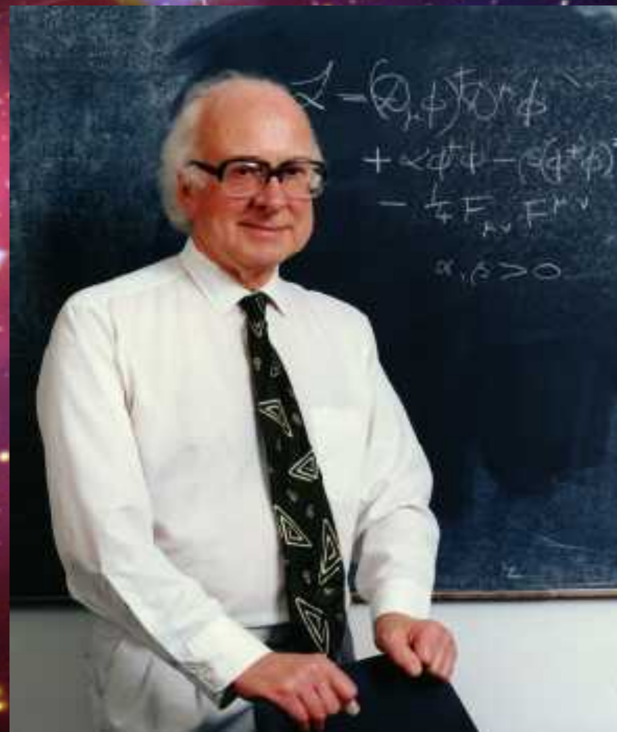
Einstein:

Energy related to Mass

Neither explained origin of Mass

Explanation of Profs P. Higgs R. Brout en F. Englert

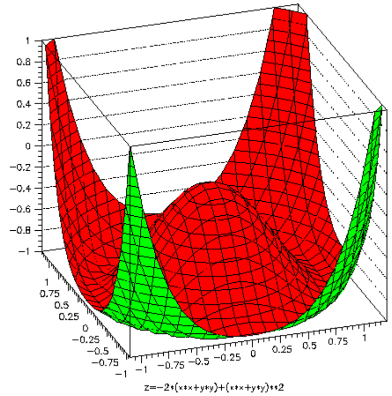
⇒ A new field and particle

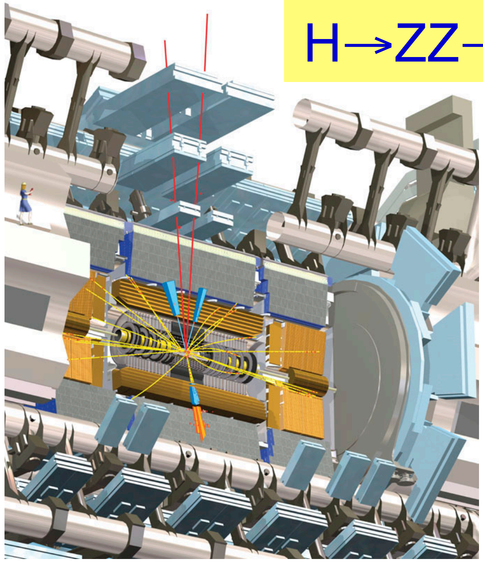


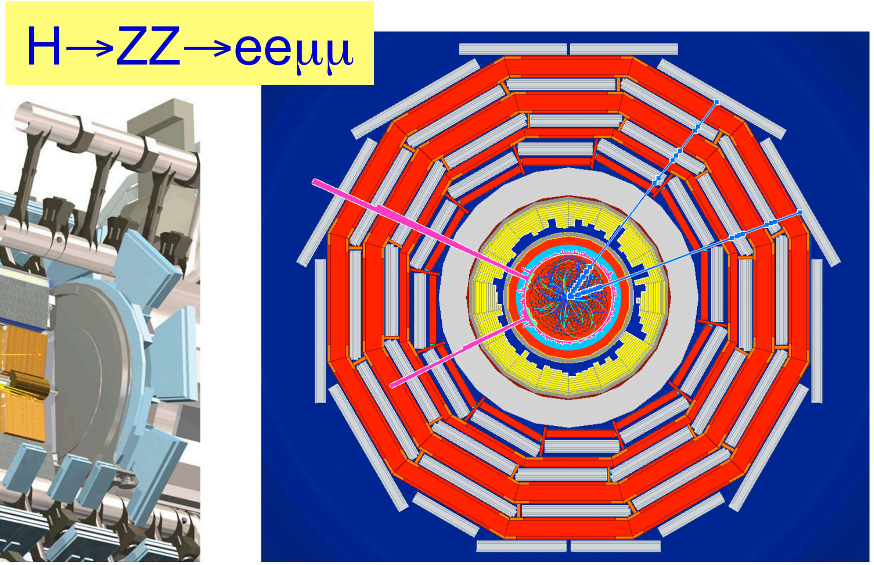
The Higgs Particle

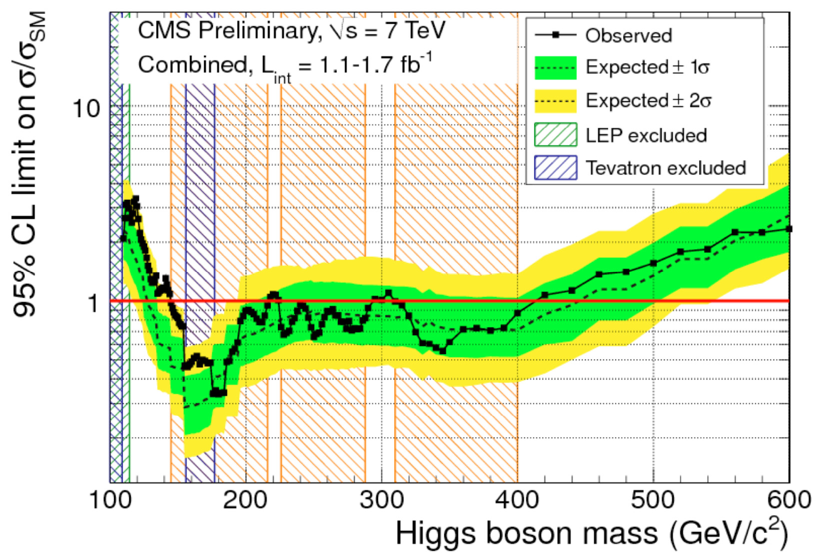
⇒ What is the origin of mass of the elementary particles?
Solution within the Standard Model: A scalar Higgs field

⇒ At least one new scalar particle should exist: The Higgs
The Higgs is the last missing particle in the Standard Model
One of the main missions of LHC: discover the Higgs





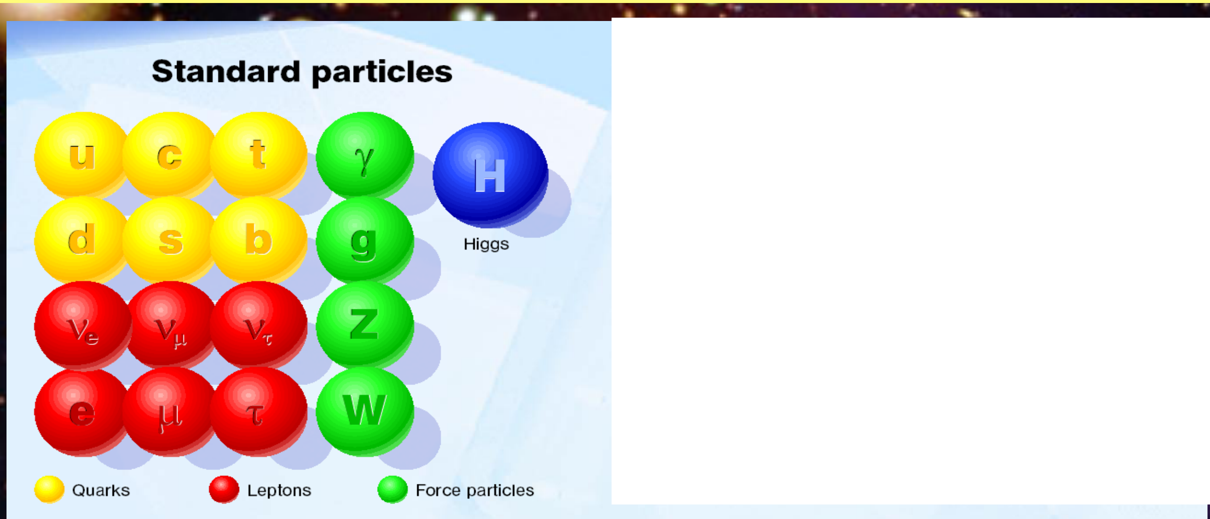


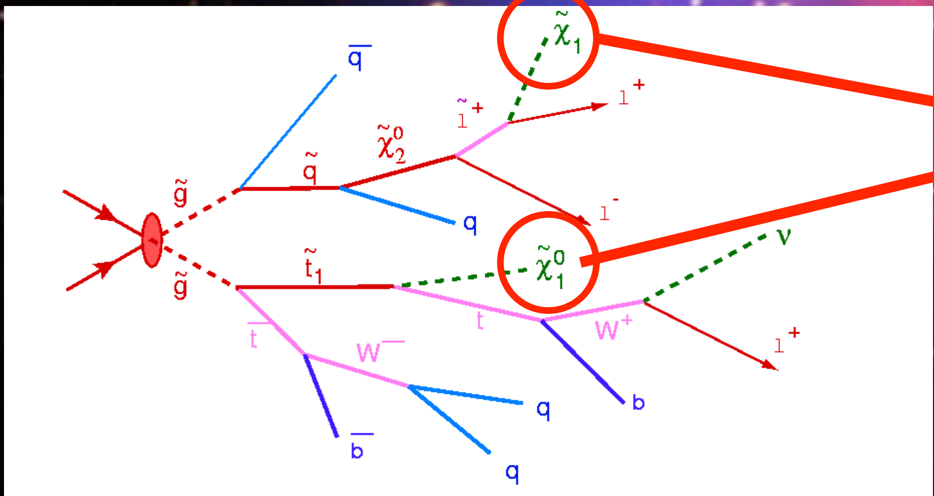


- If the Higgs exist: LHC will discover it after 2-3 years of operation
- If the Higgs does not exist: LHC should see other spectacular new effects

Beyond the Higgs Particle

Supersymmetry: a new symmetry in Nature

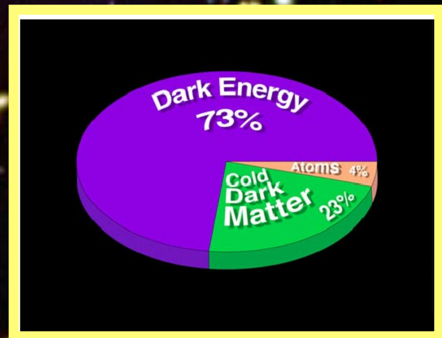




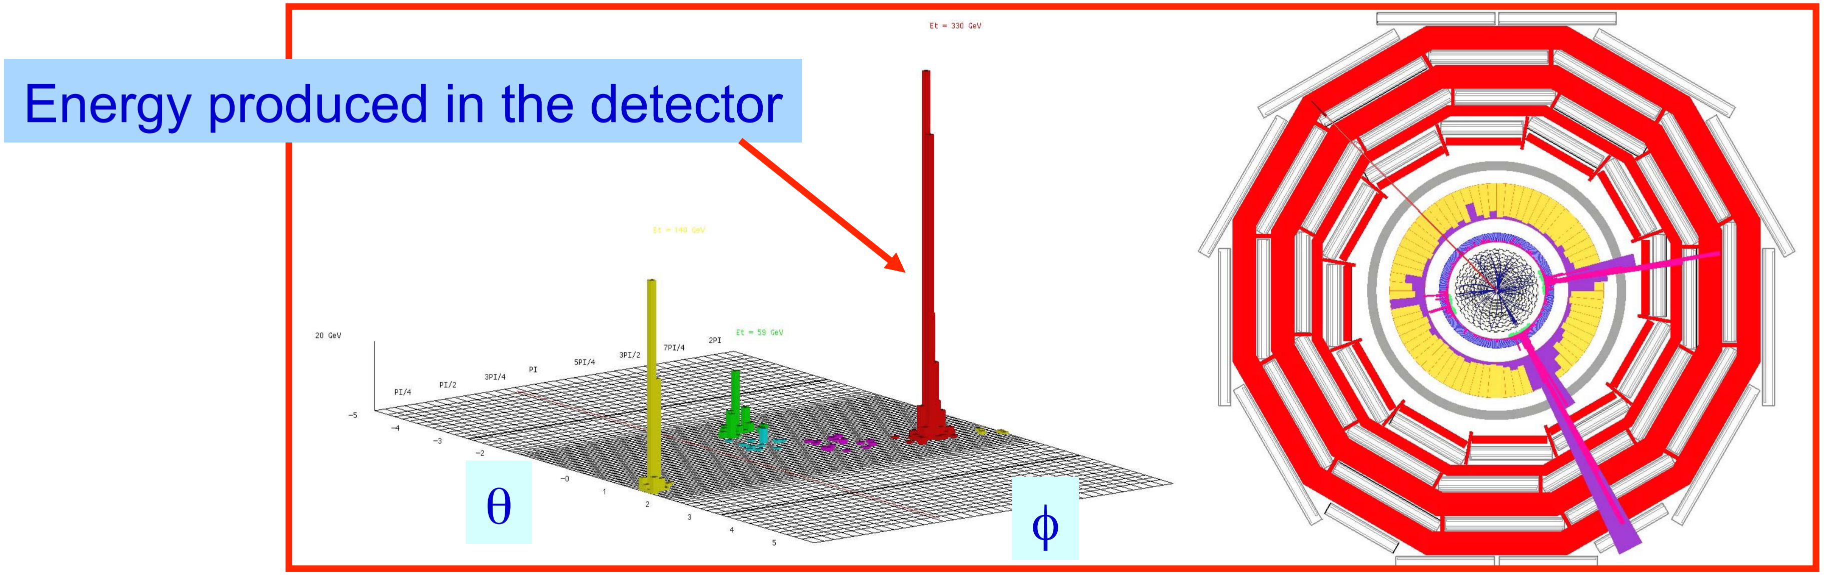
SUSY particle production at the LHC

+ 2 b-jets
+ 4 jets

Candidate particles for Dark Matter
⇒ Produce Dark Matter in the lab



Detecting Supersymmetric Particles



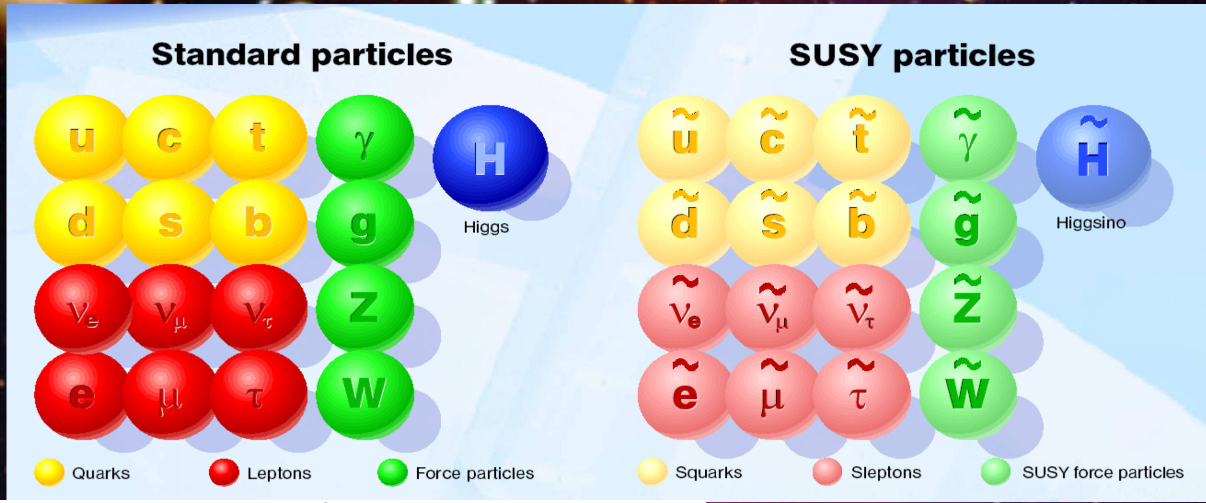
Supersymmetric particles decay and produce a cascade of jets, leptons and missing (transverse) energy due to escaping 'dark matter' particles

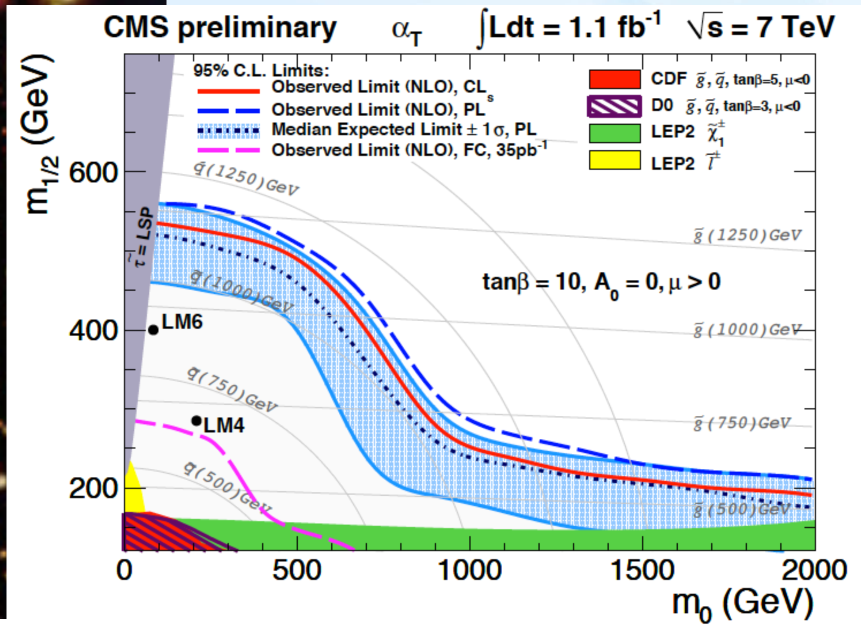
⇒ Very clear signatures in CMS and ATLAS

LHC can discover supersymmetric partners of the quarks and gluons as heavy as 2 to 3 TeV

The expected cross sections are huge!! ⇒ 10,000 to 100,000 particles per year

Supersymmetry: a new symmetry in Nature





Susy partners are very heavy
~ 1000 mass of the proton

Picture from Marusa Bradac

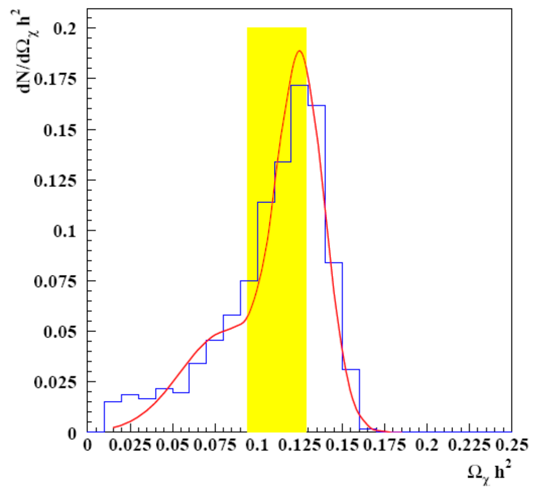
GeV	LHC
$\Delta m_{\tilde{\chi}_1^0}$	4.8
$\Delta m_{\tilde{\chi}_2^0}$	4.7
$\Delta m_{\tilde{\chi}_4^0}$	5.1
$\Delta m_{\tilde{l}_R}$	4.8
$\Delta m_{\tilde{\ell}_L}$	5.0
Δm_{τ_1}	5-8
$\Delta m_{\tilde{q}L}$	8.7
$\Delta m_{\tilde{q}R}$	7-12
$\Delta m_{\tilde{b}_1}$	7.5
$\Delta m_{\tilde{b}_2}$	7.9
$\Delta m_{\tilde{g}}$	8.0

Lightest neutralino → Dark Matter?
Fit SUSY model parameters to the measured SUSY particle masses to extract $\Omega\chi h^2$ ⇒ O(10%)

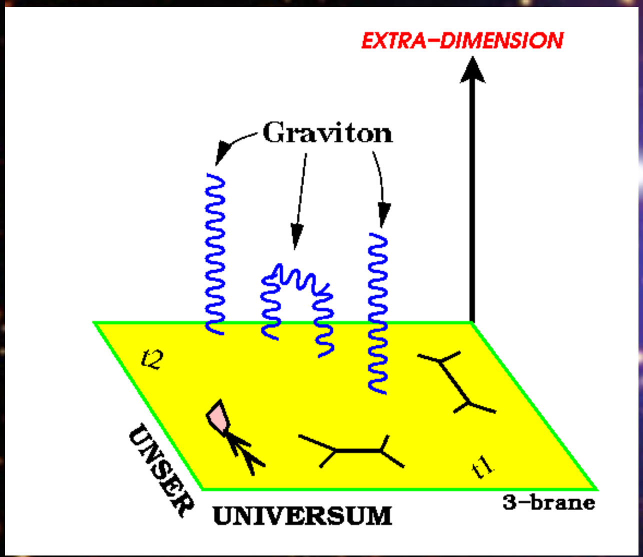


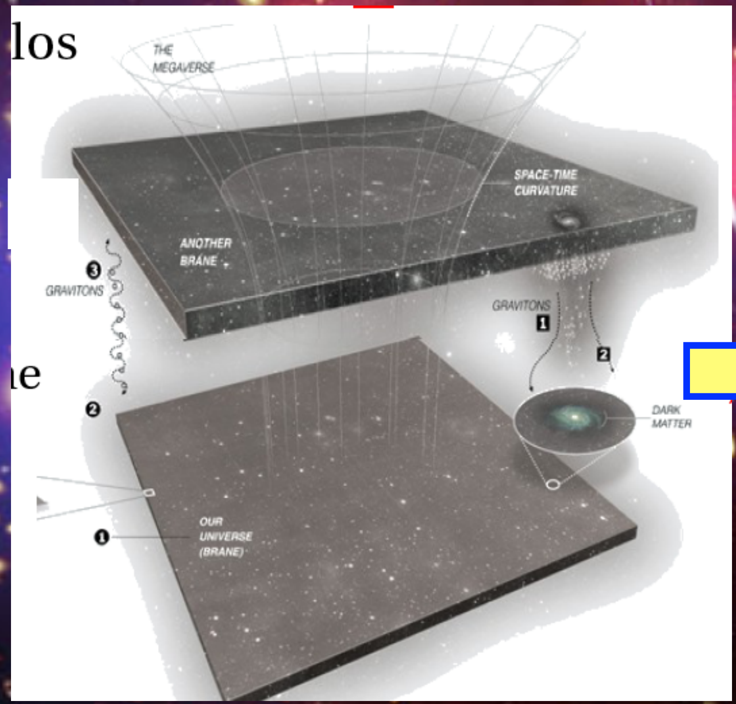
Beyond the Higgs Particle

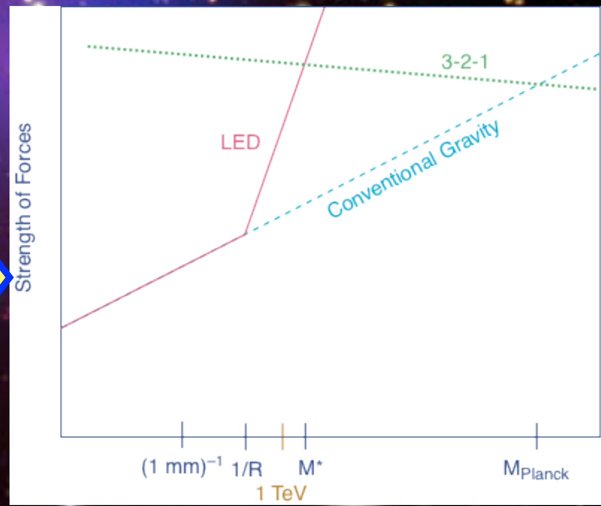
Extra Space Dimensions

Problem:

$$m_{EW} = \frac{1}{(G_F \cdot \sqrt{2})^{\frac{1}{2}}} = 246 \text{ GeV} \quad \Longleftrightarrow \quad M_{Pl} = \frac{1}{\sqrt{G_N}} = 1.2 \cdot 10^{19} \text{ GeV}$$



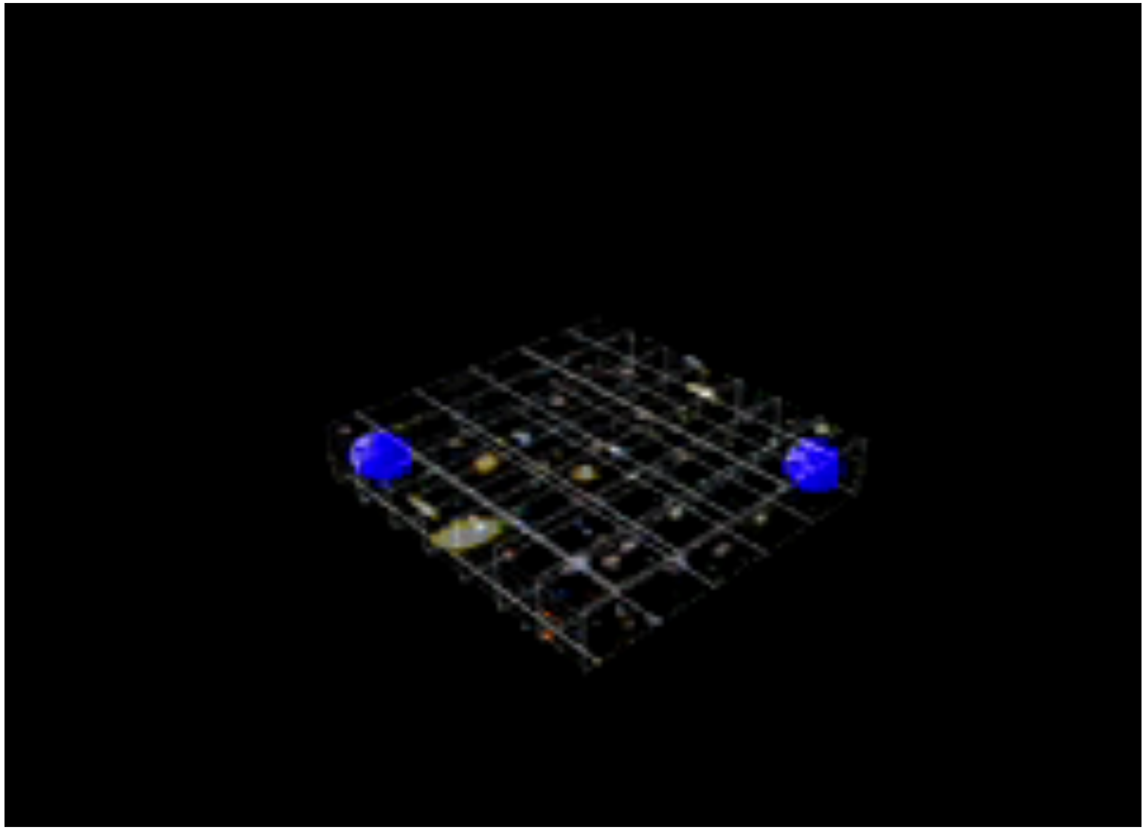


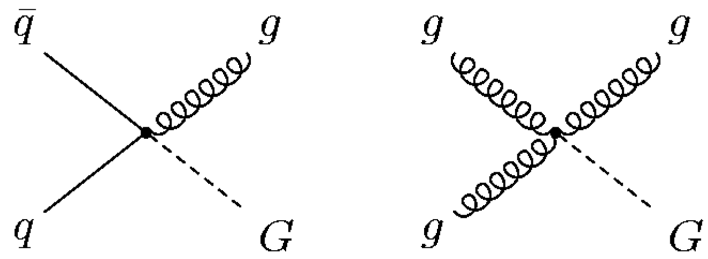


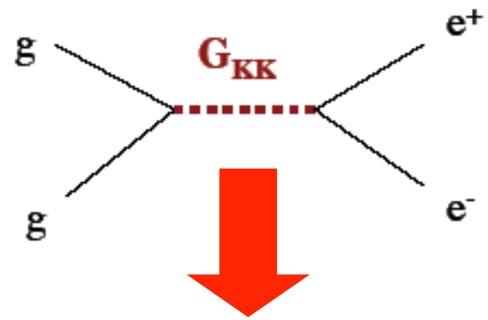
The Gravity force becomes strong!

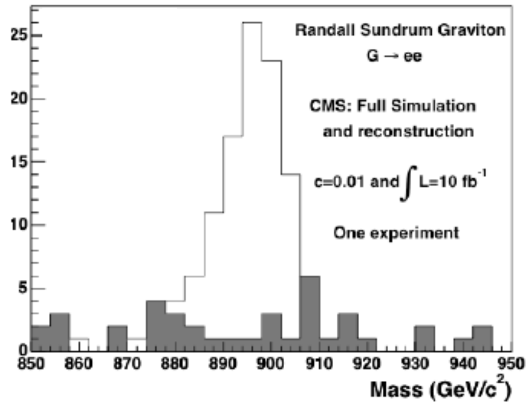
Detecting Extra Dimensions at the LHC

Main detection modes at the experiments
- Large missing (transverse) energy
- Resonance production







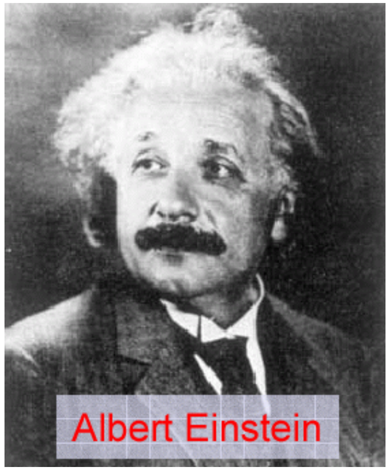


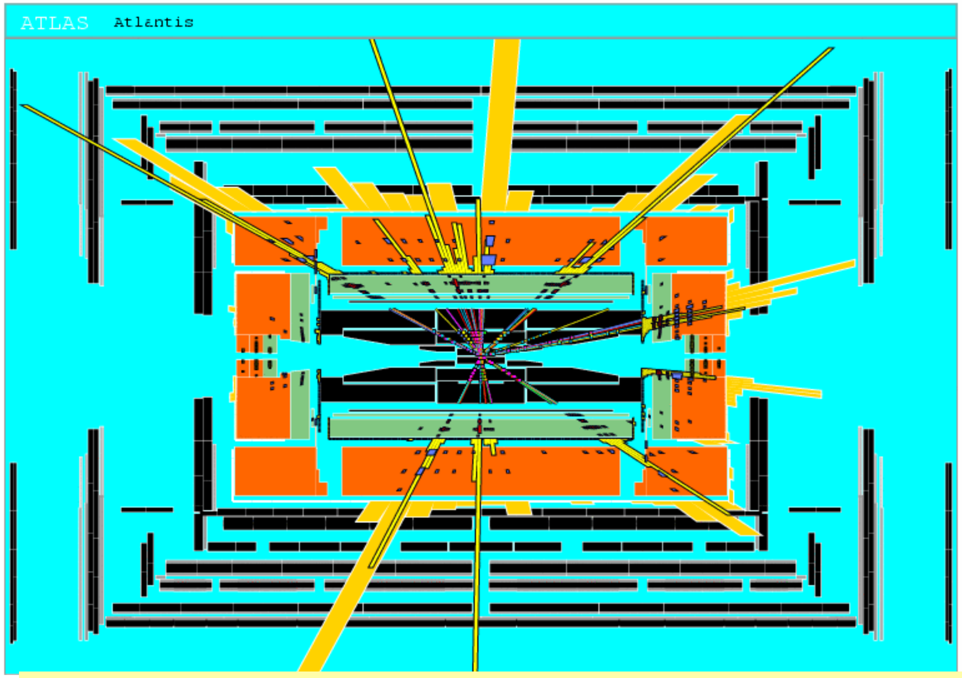
LHC can detect extra dimensions for scales up to 5 to 9 TeV

Quantum Black Holes at the LHC?

Black Holes are a direct prediction of Einstein's general theory on relativity

If the Planck scale is in ~TeV region:
can expect Quantum Black Hole production





Simulation of a Quantum Black Hole event

Quantum Black Holes are harmless for the environment: they will decay within less than 10^{-27} seconds

Quantum Black Holes open the exciting perspective to study Quantum Gravity in the lab!

Quantum Back Holes

- Schwarzschild radius

Landsberg, Dimopoulos
Giddings, Thomas, Rizzo…

4-dim., $M_{gravity} = M_{Planck}$

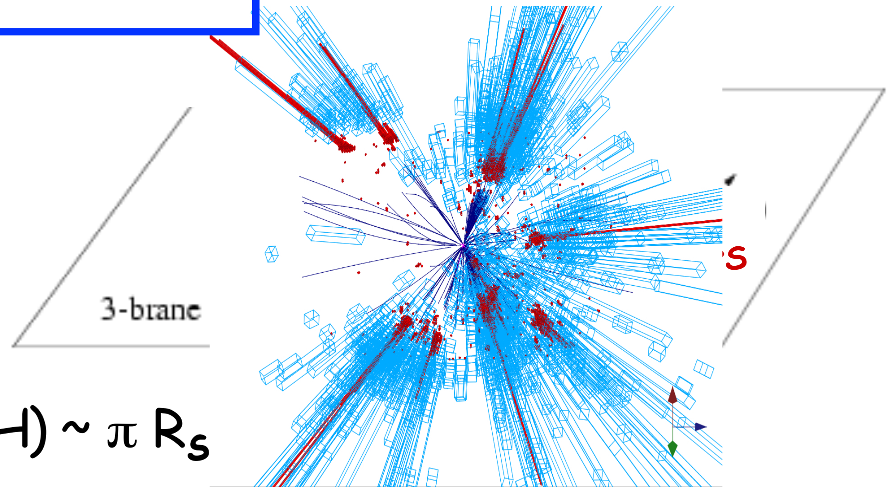
4 + n-dim., $M_{gravity} = M_D \sim$ TeV

$R_s \rightarrow \ll 10^{-35}$ m

$R_s \rightarrow \sim 10^{-19}$ m

⬇

Since M_D is low, tiny black holes of $M_{BH} \sim$ TeV can be produced if partons ij with $\sqrt{s_{ij}} = M_{BH}$ pass at a distance smaller than R_S



- Large partonic cross-section : $\sigma(ij \rightarrow BH) \sim \pi R_S$
- $\sigma(pp \rightarrow BH)$ is in the range of 1 nb – 1 fb

e.g. For M_D ~1 TeV and n=3, produce 1 event/second at the LHC

- Black holes decay immediately by Hawking radiation (democratic evaporation) :

-- large multiplicity
-- small missing E
-- jets/leptons ~ 5

} expected signature (quite spectacular …)

Quantum Black Holes

- Can LHC destroy the planet?

  $\Rightarrow$ No!

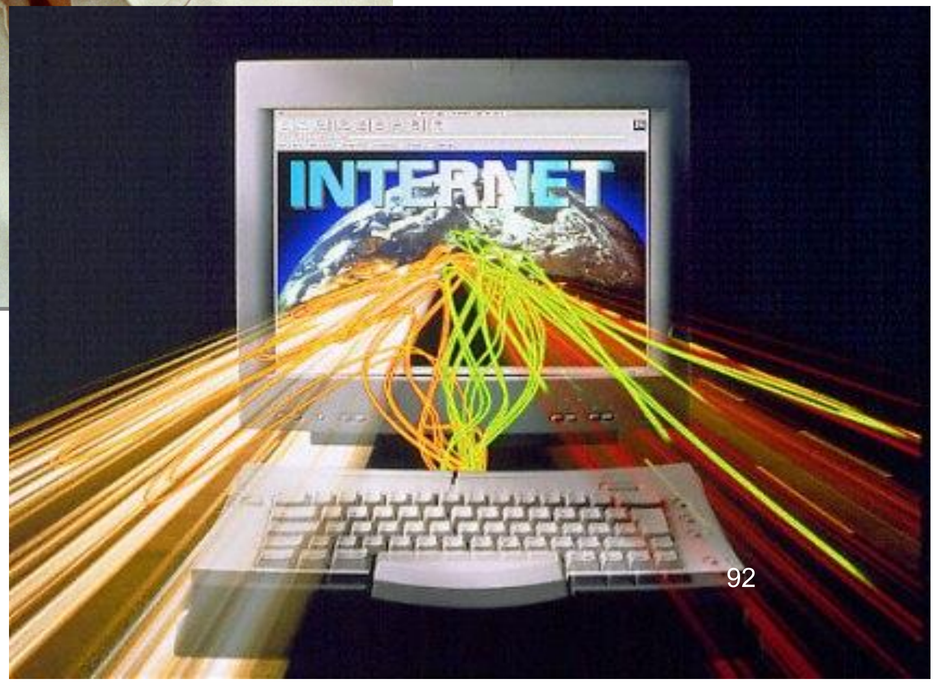
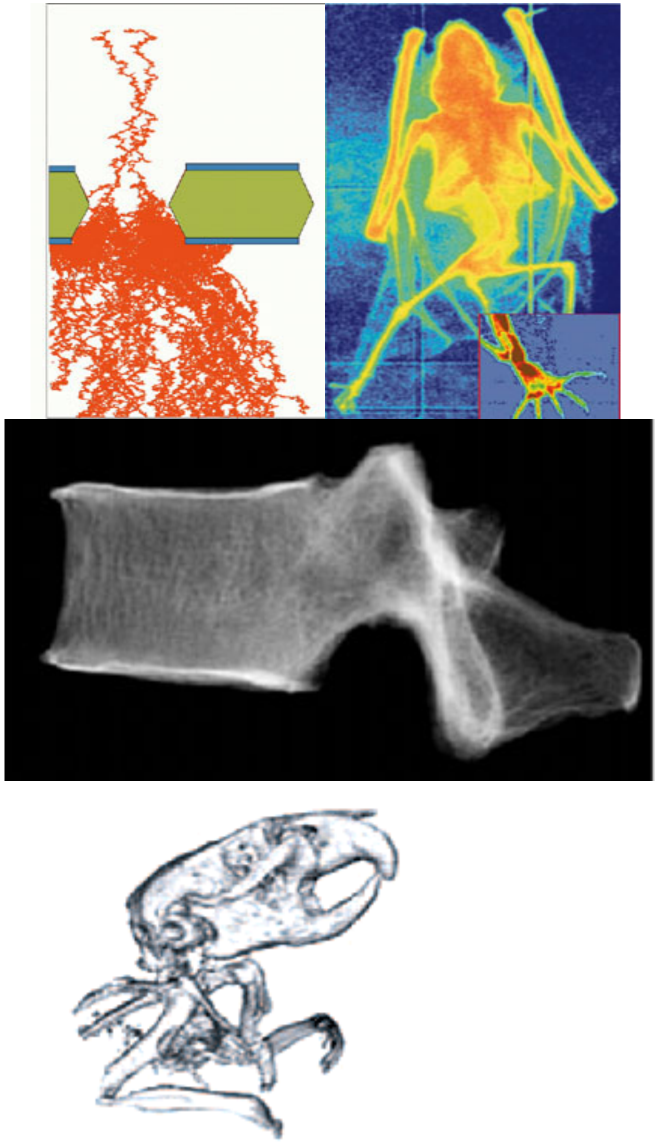
Have you heard of the World Wide Web or the Internet ?

Tim Berners Lee Developed the WWW at CERN initially for sharing particle physicists data



I think there is a world market for maybe five computers.
--THOMAS WATSON, chairman of IBM, 1943.

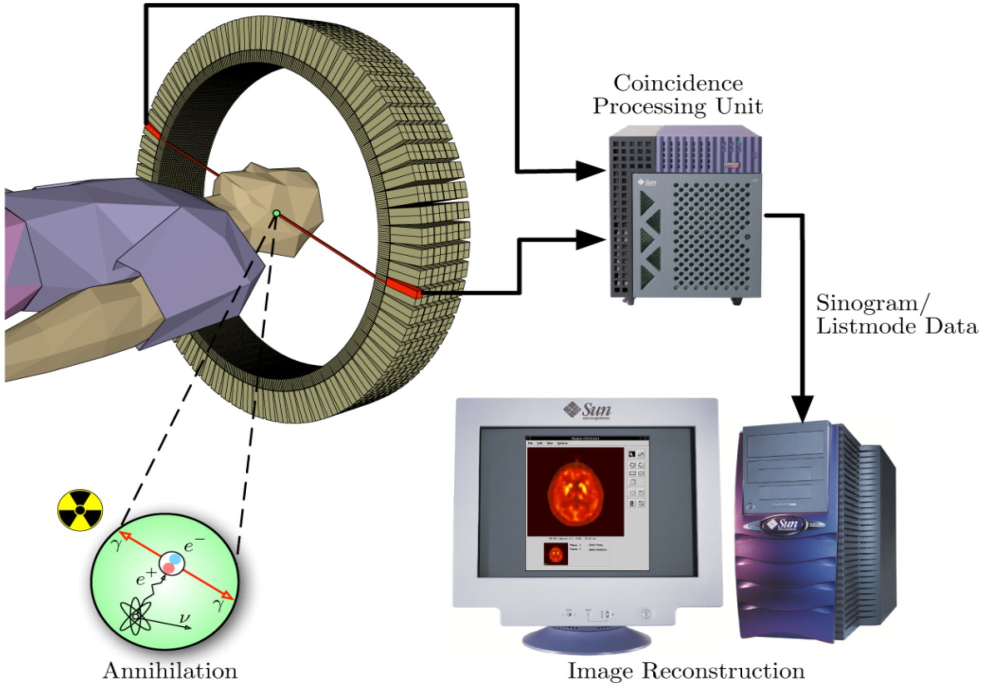
Instrumentation at CERN

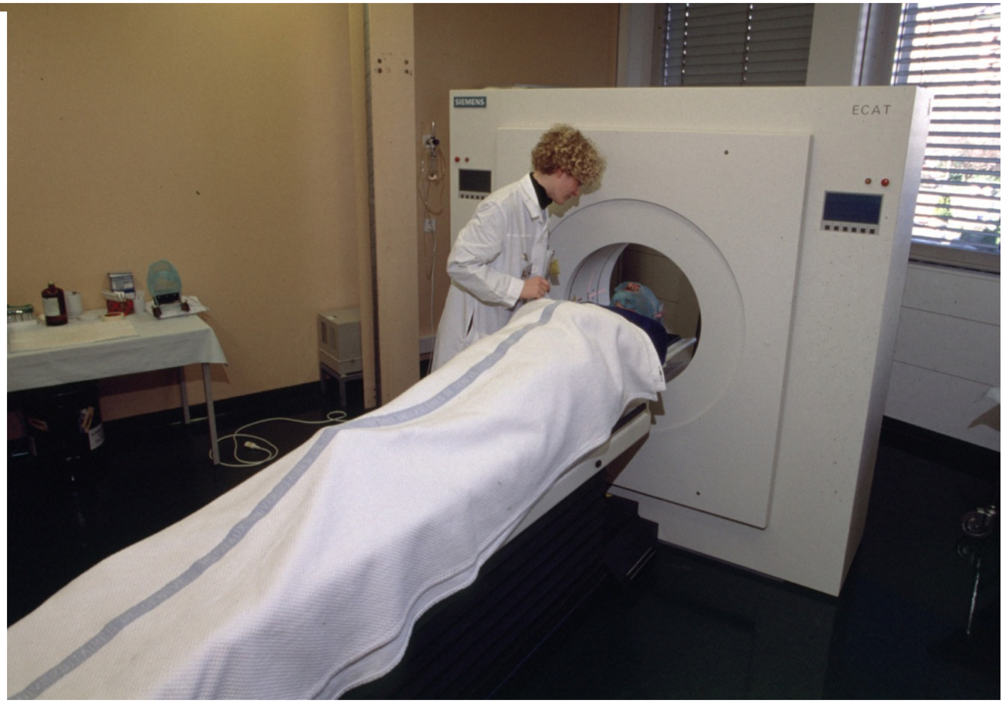


Detectors used in LHC

We use state-of-the-art instruments to explore our understanding of nature. Physicists take this knowledge to other fields. Studies have demonstrated that the transfer of knowledge from fundamental research enables high-tech companies to remain on the cutting edge of innovation and generates a variety of social and economic benefits. It also has an important impact on our culture and education.

Detectors: developed in physics labs are used for medical imagery





PET (Positron Emission Tomography) is a very important technique for localising and studying certain types of cancer using the Fluor-18 isotope produced by particle accelerators. PET uses antimatter (positrons).

Scientific Applications:

EGEE Makes Rapid Earthquake Analysis Possible

Using the advanced Grid infrastructure of the Enabling Grids for E-sciencE (EGEE) project, researchers at the Institut de Physique du Globe de Paris (IPGP), France, were able to analyze, within 30 hours of it occurring, the large Indonesian earthquake that struck on March 28. Although less severe than the one in December, which caused a tsunami wave in the Indian Ocean, more than 1,000 people were killed in this second major earthquake.

The analysis showed that the March earthquake was not a belated aftershock of the December one, although they are intricately linked. The March earthquake was probably triggered by the one in December, but happened in a different part of the fault line further south, and the mechanisms of the two earthquakes were different. Although the basic geometry of the region is known, the strength of the earthquake was astonishing.

Understanding the exact parameters of when, where and how an earthquake occurs brings researchers closer to comprehending why earthquakes happen. This might make it possible to predict when and where earthquakes will happen in the future and to assess the potential impact they could have on specific regions. Rapid analysis is particularly important for the relief efforts after a major earthquake, where those in charge need to have accurate information about the epicenter, magnitude

In the recent report from the Intergovernmental Panel on Climate Change, data from various models and sources were combined to project the future climate. This image shows Scenario A1B: simulated mean temperature change relative to 1980-1999.

Grids open new perspectives to *in silico* drug discovery

- Reduced cost and adding an accelerating factor in the search for new drugs

- Diseases such as HIV/AIDS, SRAS, Bird Flu etc. are a threat to public health due to world wide exchanges and circulation of people

Scientists gear up to tackle 15 million gigabytes of data

4 Nov 2008, 1625 hrs IST, IANS

Print | EMail | Discuss | Share | Save | Comment | Text (

LONDON: The four huge detectors of the new Large Hadron Collider near (when fully operational, are expected to generate up to a staggering 15 gigabytes of data every year.

Andreas Hirstius, manager of Openlab and the CERN Sc Computing, explained how co scientists have met the challe handling this unprecedented of data.

When CERN staff first consid the mid-1990s how they mig with the large volume of data vast circular contraption produce when its two bea protons collide, a single giga disk space still cost a few h dollars and CERN's total connectivity was equivalent to of today's broadband connections.

It quickly became clear that computing power at CERN, even taking Moore's L account, would be significantly less than that required to analyse Large Collider (LHC) data.

The solution, which transpired during 1990s, was to turn to "high-thro computing" where the focus is not on shifting data as quickly as possible fro but rather from shifting as much information as possible between those two po

High-performance computing is ideal for particle physics because the data pr in the millions of proton-proton collisions are all independent of one another - therefore be handled independently, according to an Institute of Physics (IOP) r

Large Hadron Collider could help fight cancer

Stand by for advances in health and climate research as the 'big bang' machine starts up

Jonathan Leake

The giant new particle collider at Europe's centre for nuclear research, which is due to start work on Wednesday, is being linked to spectacular spin-offs including improved cancer treatments, systems for destroying nuclear waste and insights into climate change.

"Everyone is looking at the start up of the Large Hadron Collider [LHC] but Cern has many other research programmes with important practical uses," said Paul Collier, who runs the main control room at the European Organisation for Nuclear Research (Cern).

The first beams of particles have been successfully fired around nearly half of the 17-mile tunnel in Switzerland, where Cern is based. Linked research has already spurred useful byproducts.

In a typical year, the huge machine, which will smash particles into each other at enormous speed, should generate enough data to fill 56m CDs. That means physicists have had to create a sophisticated system for organising information extremely quickly. The Grid, as they call it, is likely to become the model for many other systems designed to handle large volumes of data.

Another project has suggested a potentially radical new way of dealing with nuclear waste. Cern's physicists found that firing a beam of protons (a type of sub-atomic particle) into blocks of lead could
